Temporary Authorization Request for In-Situ Remediation of Volatile Organic Compound Contamination in the Western Sector of the A/M Area at the Savannah River Site

Please make the above documents available to the general public for a minimum of Forty-Five (45) days on August 24, 2021, after which they may be discarded.

Please acknowledge receipt of the document by email to Dexter.McDaniel@srs.gov. If you have any questions, please call me at (803) 952-7401 or e-mail me at above address.

Sincerely,

A handwritten signature in black ink, appearing to read 'Dexter McDaniel', with a large, stylized flourish extending to the right.

Dexter McDaniel
EC & ACP Records/Unclassified Records
730-4B, Room 135A

Ms. Stacey French, P.E., Director
Division of Waste Management
Bureau of Land and Waste Management
South Carolina Department of Health and Environmental Control
2600 Bull Street
Columbia, SC 29201

Dear Ms. French:

**SUBMITTAL OF THE TEMPORARY AUTHORIZATION REQUEST FOR IN-SITU
REMEDiation OF VOLATILE ORGANIC COMPOUND CONTAMINATION IN THE
WESTERN SECTOR OF THE A/M AREA AT THE SAVANNAH RIVER SITE**

The persistence of elevated groundwater concentrations of volatile organic compounds (VOCs) (i.e., trichloroethylene and tetrachloroethylene) in the Lost Lake Aquifer Zone (LLAZ) requires focused treatment to supplement the removal of these contaminants by the existing corrective action systems. To aid in determining additional corrective actions for the VOCs in the LLAZ, the Savannah River Site (SRS) proposed three temporary authorizations (TAs) for the Western Sector in the 2013 RCRA Permit Renewal Application: M-Area and Metallurgical Laboratory Hazardous Waste Management Facilities Postclosure (SRNS-IM-2012-00002, Volume III). With South Carolina Department of Health and Environmental Control (SCDHEC) approval, two of the three Western Sector TAs have been implemented. The TAs implemented to date include (1) installation of recovery well RWM018 and the deployment of in-situ chemical oxidation (ISCO-I and ISCO-II) and (2) installation of RWM019 and the conversion of RWM 9 and RWM 11 to monitoring wells. RWM018 was installed in July 2017 and became operational as part of the M-1 Air Stripper system in May 2018. ISCO-I was performed between August and October 2018. ISCO-II was performed between August 27, 2020 and September 8, 2020. Three interim reports have been submitted on the performance of ISCO. A final report on ISCO performance is currently planned for submittal in fiscal year 2023. RWM019 was installed in January 2019 and became operational as part of the M-1 Air Stripper system in July 2020. RWM 9 and RWM 11 are monitored semi-annually as plume definition wells.

The purpose of this letter is to request approval for the third TA. The third TA proposes to implement emulsified zero-valent iron (EZVI) as an in-situ remedial technology to remove residual dense non-aqueous phase liquid (DNAPL) in the subsurface. The SRS discussed this proposal with SCDHEC on December 14, 2020 during an Adobe Webcast Meeting. During this meeting, the SCDHEC requested that SRS wait to submit this TA until the third Western Sector ISCO report was submitted and approved. The report (SRNS-STI-2021-00048, Revision 0, March 2021) was submitted on April 5, 2021. SCDHEC provided comments on the report on June 3, 2021 (SRNS-OS-2021-00147). SRS provided responses to the comments and SCDHEC approved the responses on July 19, 2021 (SRNS-J2000-2021-00585) and August 9, 2021 (SRNS-OS-2021-00222), respectively. As discussed in the proposal, the EZVI mix will consist of edible oil, micro-scale ZVI, surfactant and other vendor specific amendments. The EZVI mixture will be diluted with water and injected in six injection points using hydraulic fracturing through drilling casings.

The injections will be followed by chase water to achieve the desired radius of influence. The injection activities will be monitored through four new proposed monitoring wells. SRS proposes to perform a year of monitoring to look at changes in the VOC concentrations, reductive dechlorination parameters (i.e., pH, dissolved oxygen, and oxidation-reduction potential, DNAPL destruction indicators (i.e., chloride and mercury), iron and secondary metals.

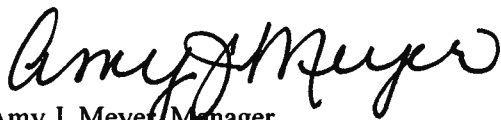

Oxidants from the Western Sector ISCO project entered the M-1 Air Stripper inlet and interfered with the reduction of mercury from the stannous chloride system. Due to this impact on the M-1 Air Stripper, the proposal was updated to discuss the impacts of EZVI based on monitoring data from the P-Area Groundwater Operable Unit removal action ZVI-permeable reactive barrier (PRB). As part of the evaluation, the ZVI-PRB monitoring data was compared to the limits defined by the M-1 Air Stripper Waste Acceptance Criteria (WAC). Based on the evaluation, the potential for impact to the M-1 Air Stripper is very low and is not expected. However, purge water management systems will be installed on the four proposed monitoring wells to avoid exceeding the M-1 Air Stripper WAC. In addition, contingent monitoring will be performed at RWM 8 and RWM 10 if elevated iron, pH, or metal concentrations are observed at the four proposed monitoring wells.

At the end of the year of monitoring, an effectiveness evaluation report will be submitted to SCDHEC. The results will be used to support the final corrective action recommendations for Western Sector and could also have applicability to other portions of the overall A/M Area VOC plume.

All applicable regulatory approvals (i.e., TA, underground injection control, etc.) will be obtained prior to field deployment of the information discussed in this TA request. SRS requests that the TA, based on the information above and the enclosure, become effective when notification is provided that the EZVI injections have started. SRS will provide notification of the start date to the SCDHEC via e-mail.

Please review the information in this letter and provide a response within sixty (60) days of receipt. If you have any questions, please contact Shelia McFalls at (803) 952-6819.

Sincerely,

Amy J. Meyer, Manager
Environmental Compliance
Environmental Compliance & Area Completion Projects

Technical Briefing on Proposed Temporary Authorization to SC Department of Health and Environmental Control,

August 2021

SRNS-RP-2020-00843

M-Area and Met Lab Hazardous Waste Management Facilities Corrective Action

- **Over 35 years of Corrective Action**
 - Groundwater = ~0.5 mil lbs
 - *Pump and Treat*
 - *Airlift Recirculation Wells*
 - Soil Vapor Extraction (SVE) = ~0.5 mil lbs
 - *SVE Units*
 - *MicroBlowers™*
 - *BaroBalls™*
 - Dynamic Underground Stripping (DUS) = ~0.5 mil lbs
- **Over 1.5 million pounds of solvent have been removed**

Western Sector Characterization

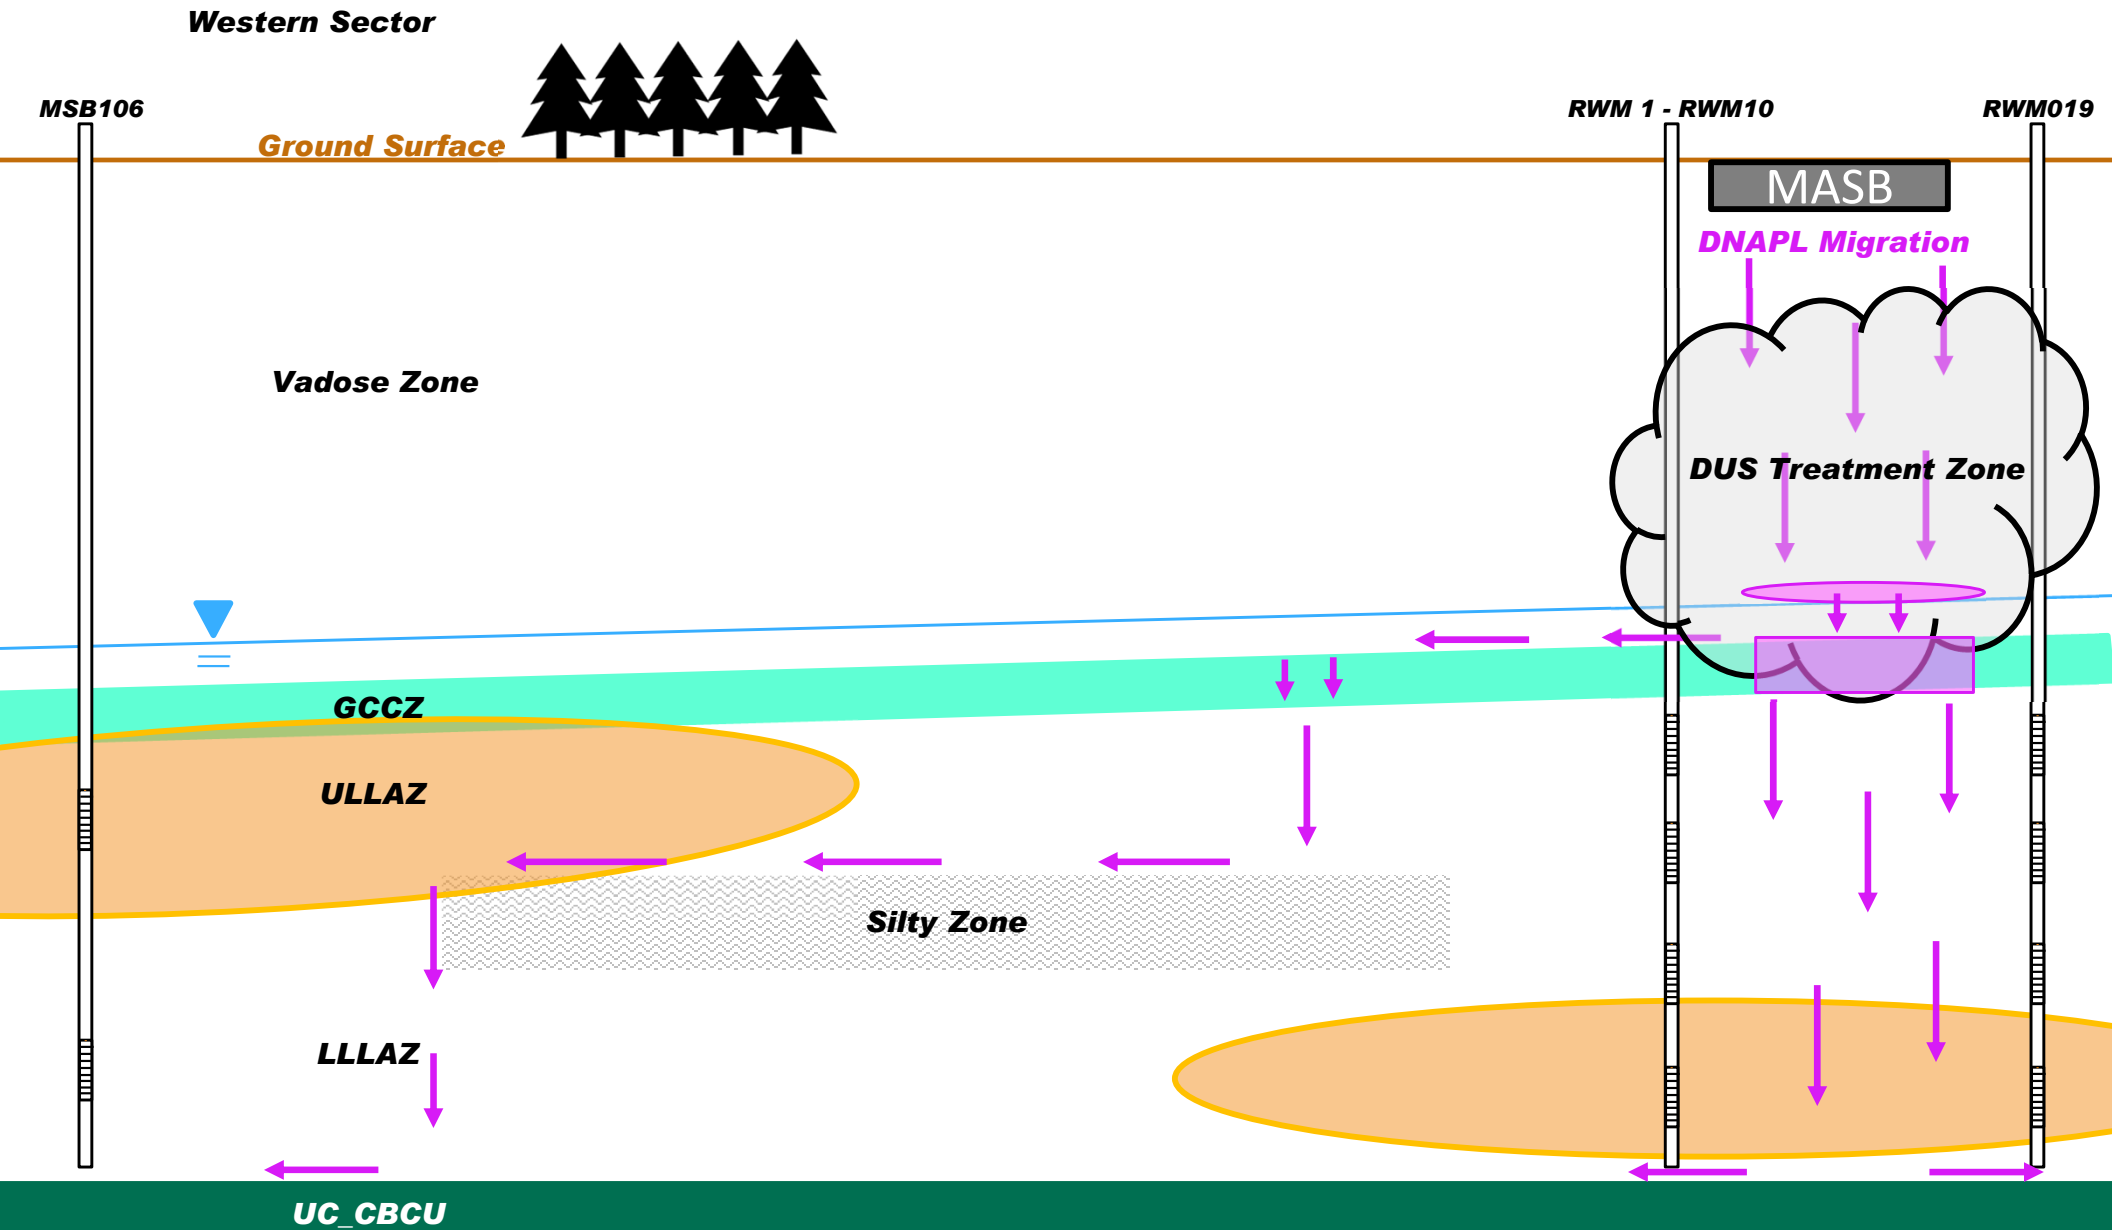

- **Multiple Characterization Efforts from 1994 to 2020**
 - 1994 to 1998 (Phase I and II) – high concentrations of volatile organic compound (VOC) in the Lost Lake Aquifer Zone (LLAZ) soils
 - 2008 – Monitoring wells verified high concentrations ($>10,000 \mu\text{g/L}$ [ppb]) of VOC in the LLAZ
 - 2013 – Post DUS-II verification
 - 2014 to 2016 (Phase III) – Further characterize the high concentration VOC plume
 - 2020 – Define high concentration plume connecting the M-Area Settling Basin (MASB) and Western Sector

Western Sector Corrective Action

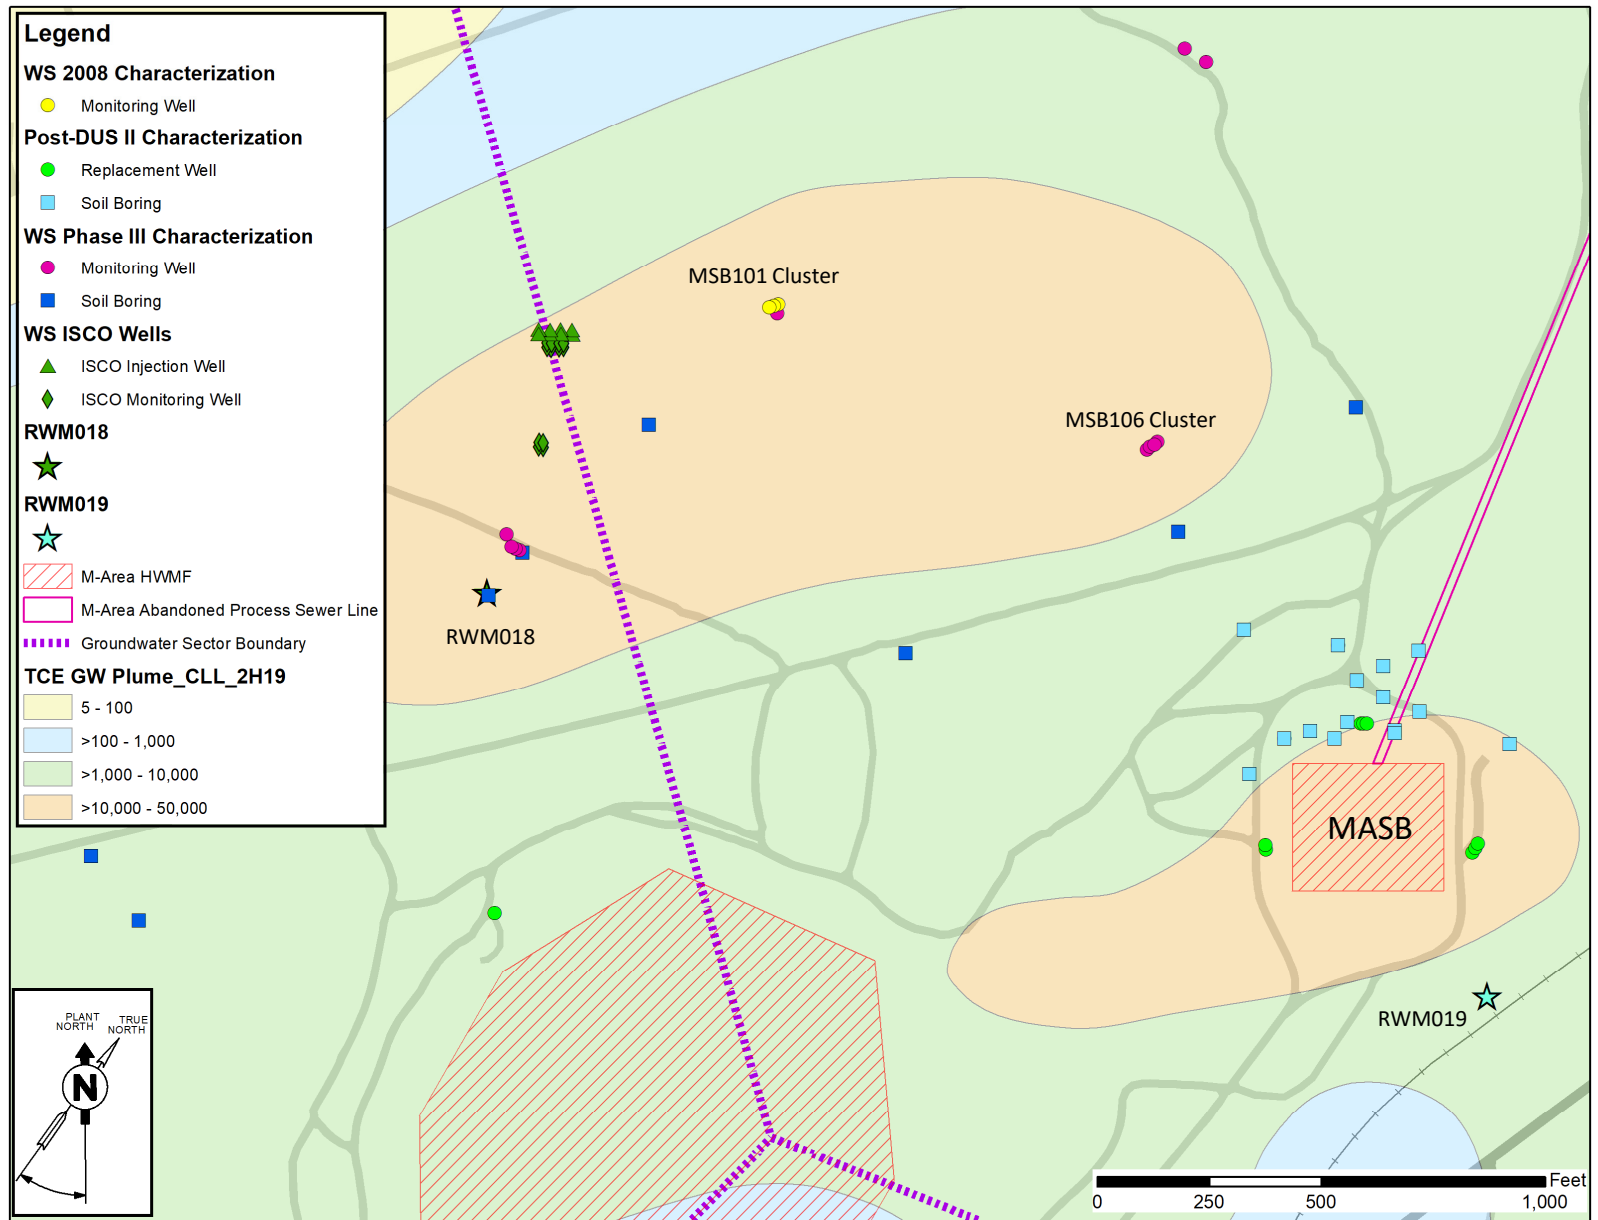

- **Temporary Authorization (TA) – RWM018 and In-situ Chemical Oxidation (2018/2020)**
 - RWM018 installed to capture high concentration VOC plume outside of the existing M-1 zone of capture
 - First campaign - Injection 80,000 gal of oxidant (permanganate and persulfate)
 - Second campaign – Injected 40,000 gal of oxidant (permanganate and persulfate)
- **TA – RWM019 (2020)**
 - Capture high concentration VOC plume on the southeastern corner of the MASB
- **Proposed TA – In-Situ Remedial Technology**
 - **Objective:** Implement an Emulsified Zero-Valent Iron (EZVI) remedial technology to remove residual dense non-aqueous phase liquid (DNAPL) in the subsurface
 - Pilot scale field study that could be scaled up if effective
 - Results of the three TAs will be used to develop the Corrective Measures Study and the final Corrective Action Plan for Western Sector

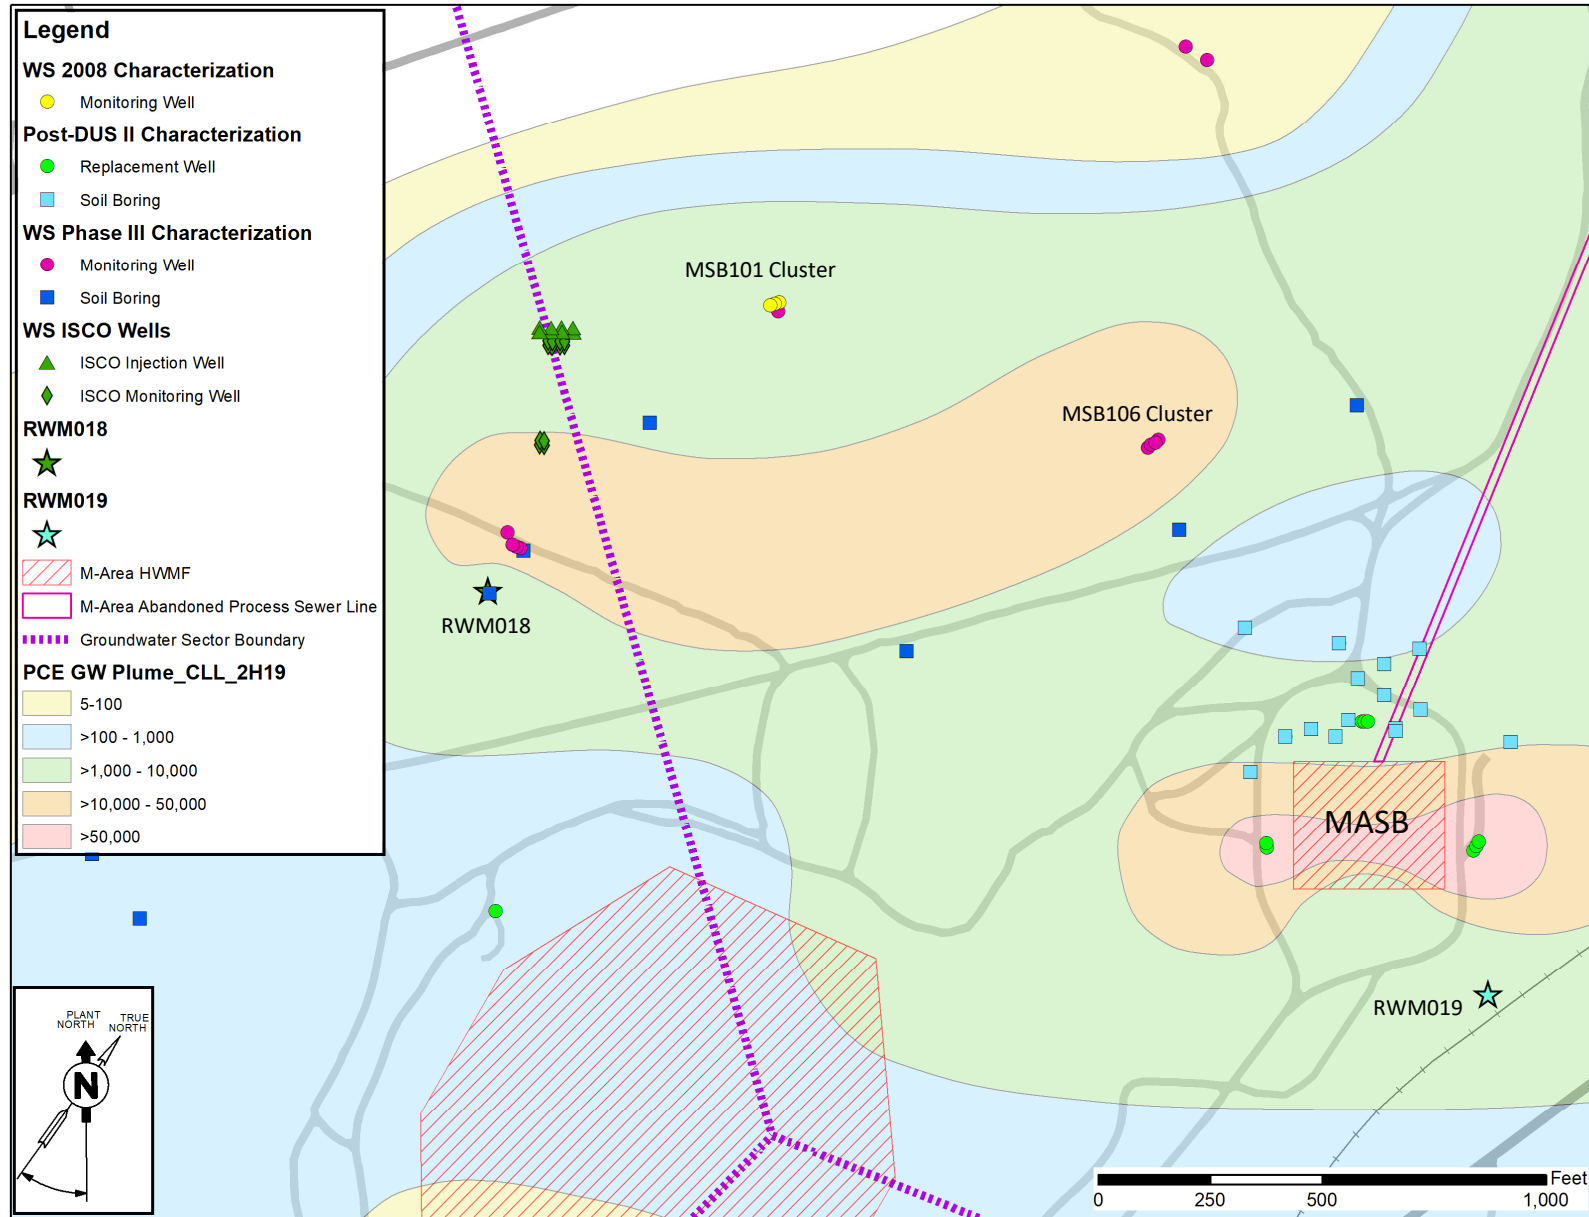

Contaminant Migration Conceptual Model (not to scale)

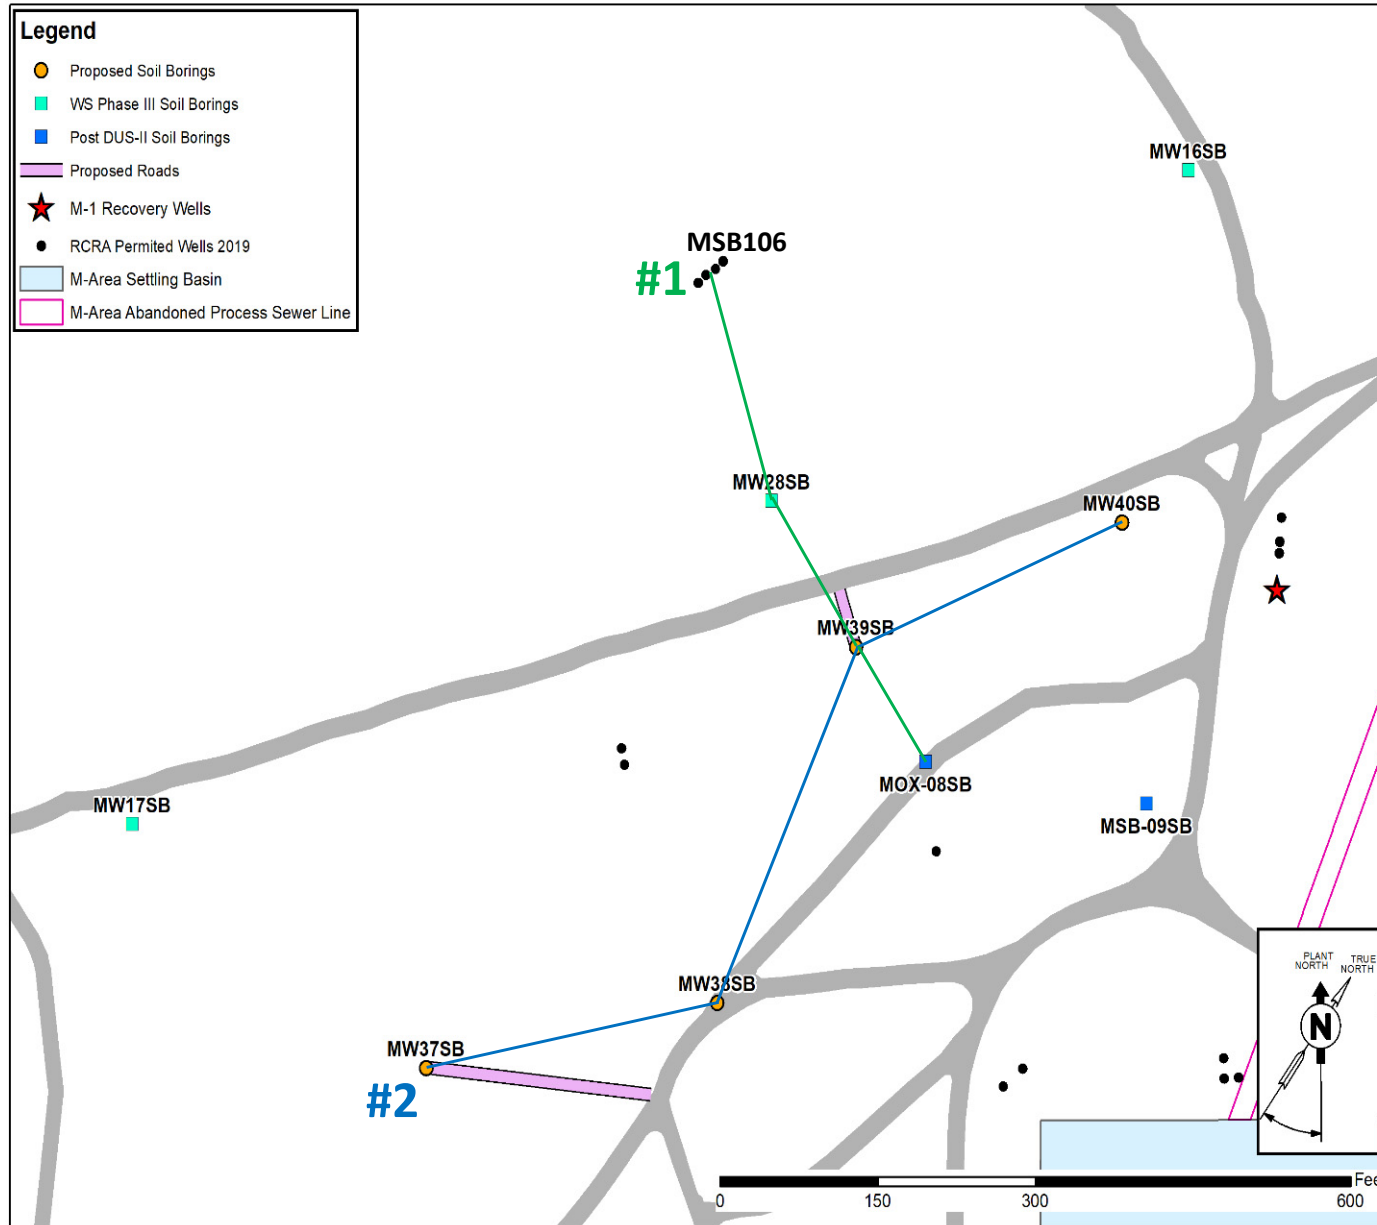

Western Sector Trichloroethylene (TCE) plume in the LLAZ (2019)

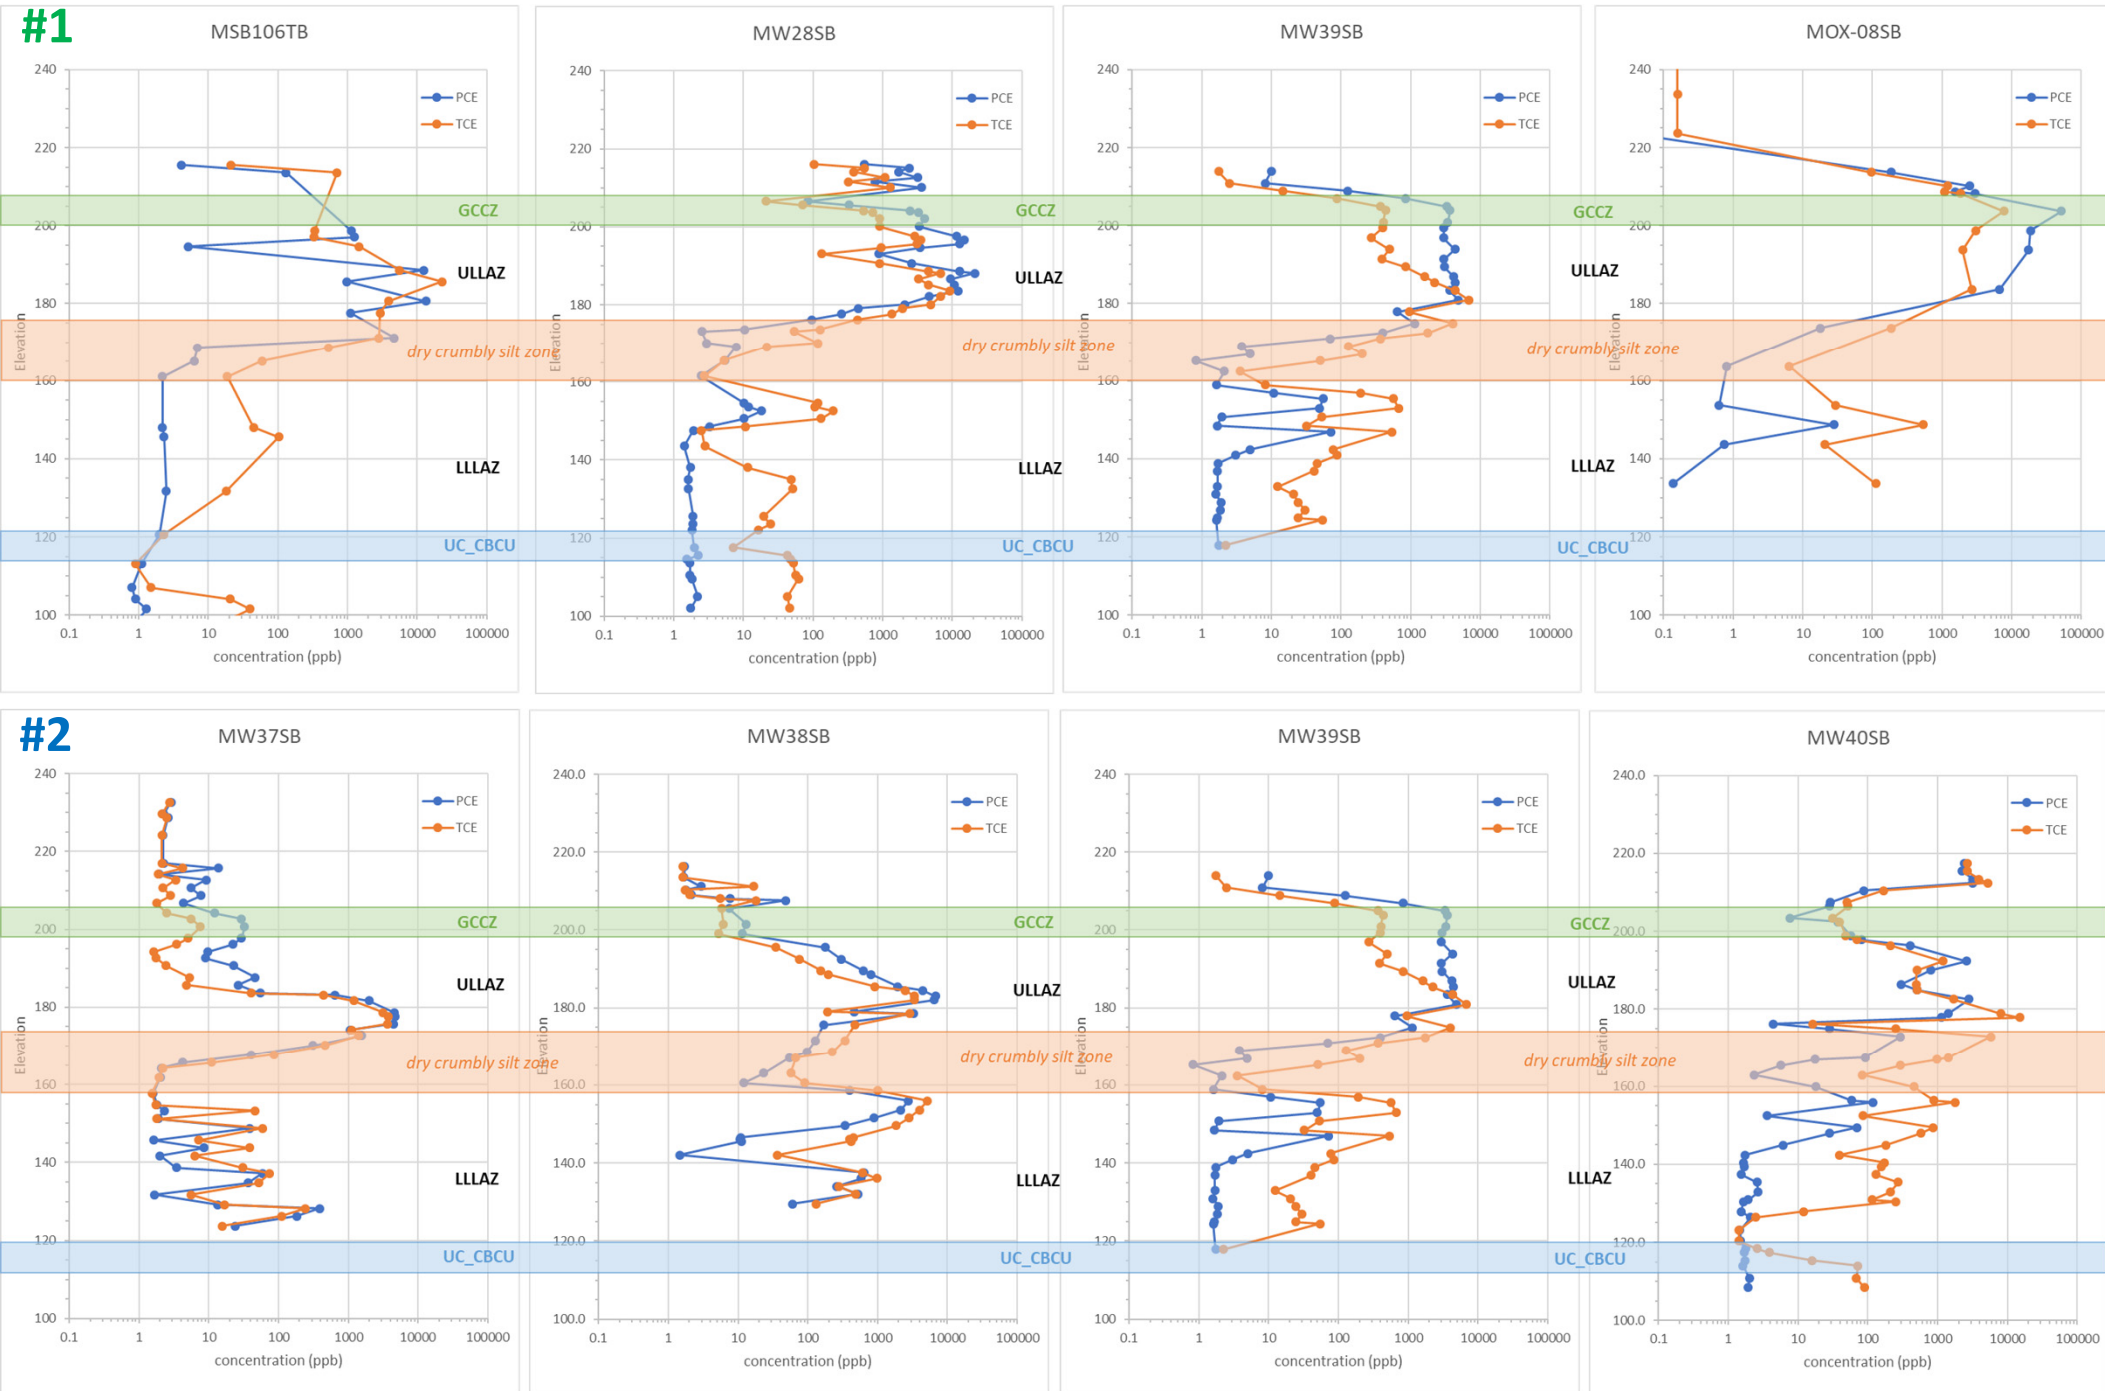

Western Sector Tetrachloroethylene (PCE) plume in the LLAZ (2019)

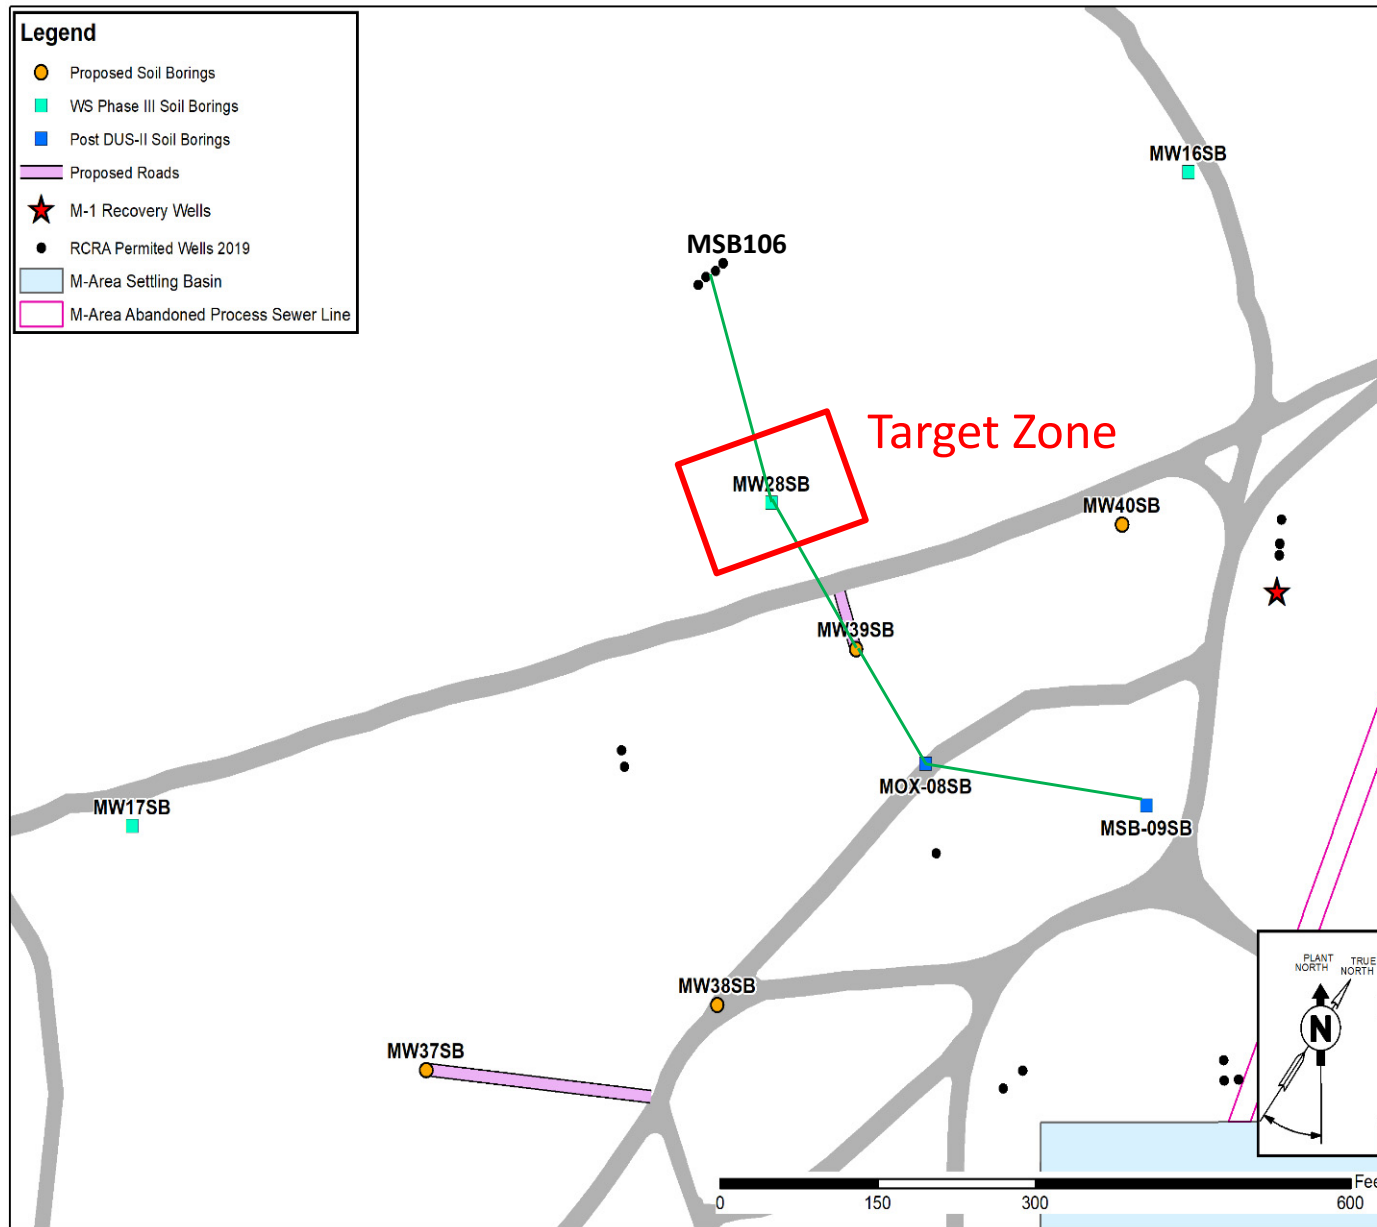

TA Northwest of MASB Soil Investigation

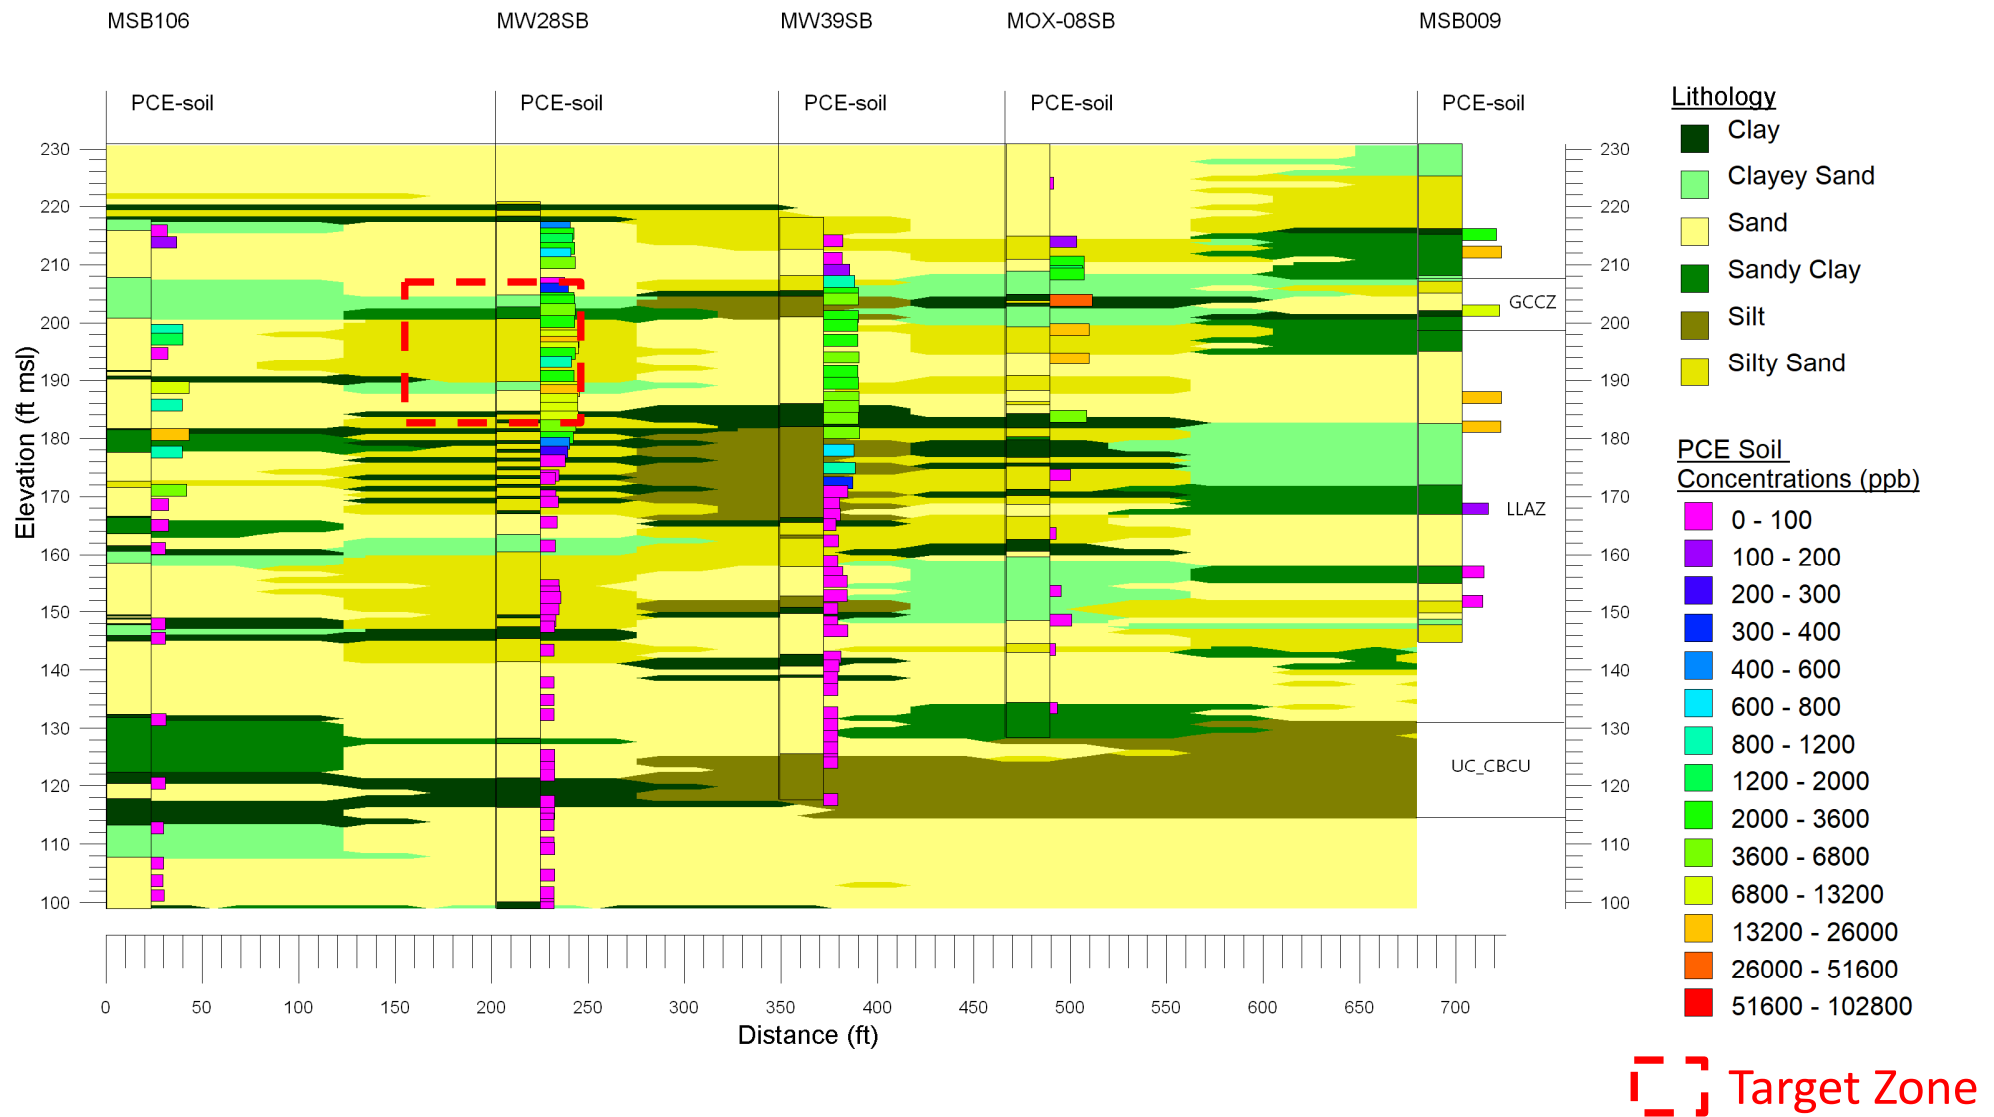

TA Northwest of MASB Soil Investigation (Continued)

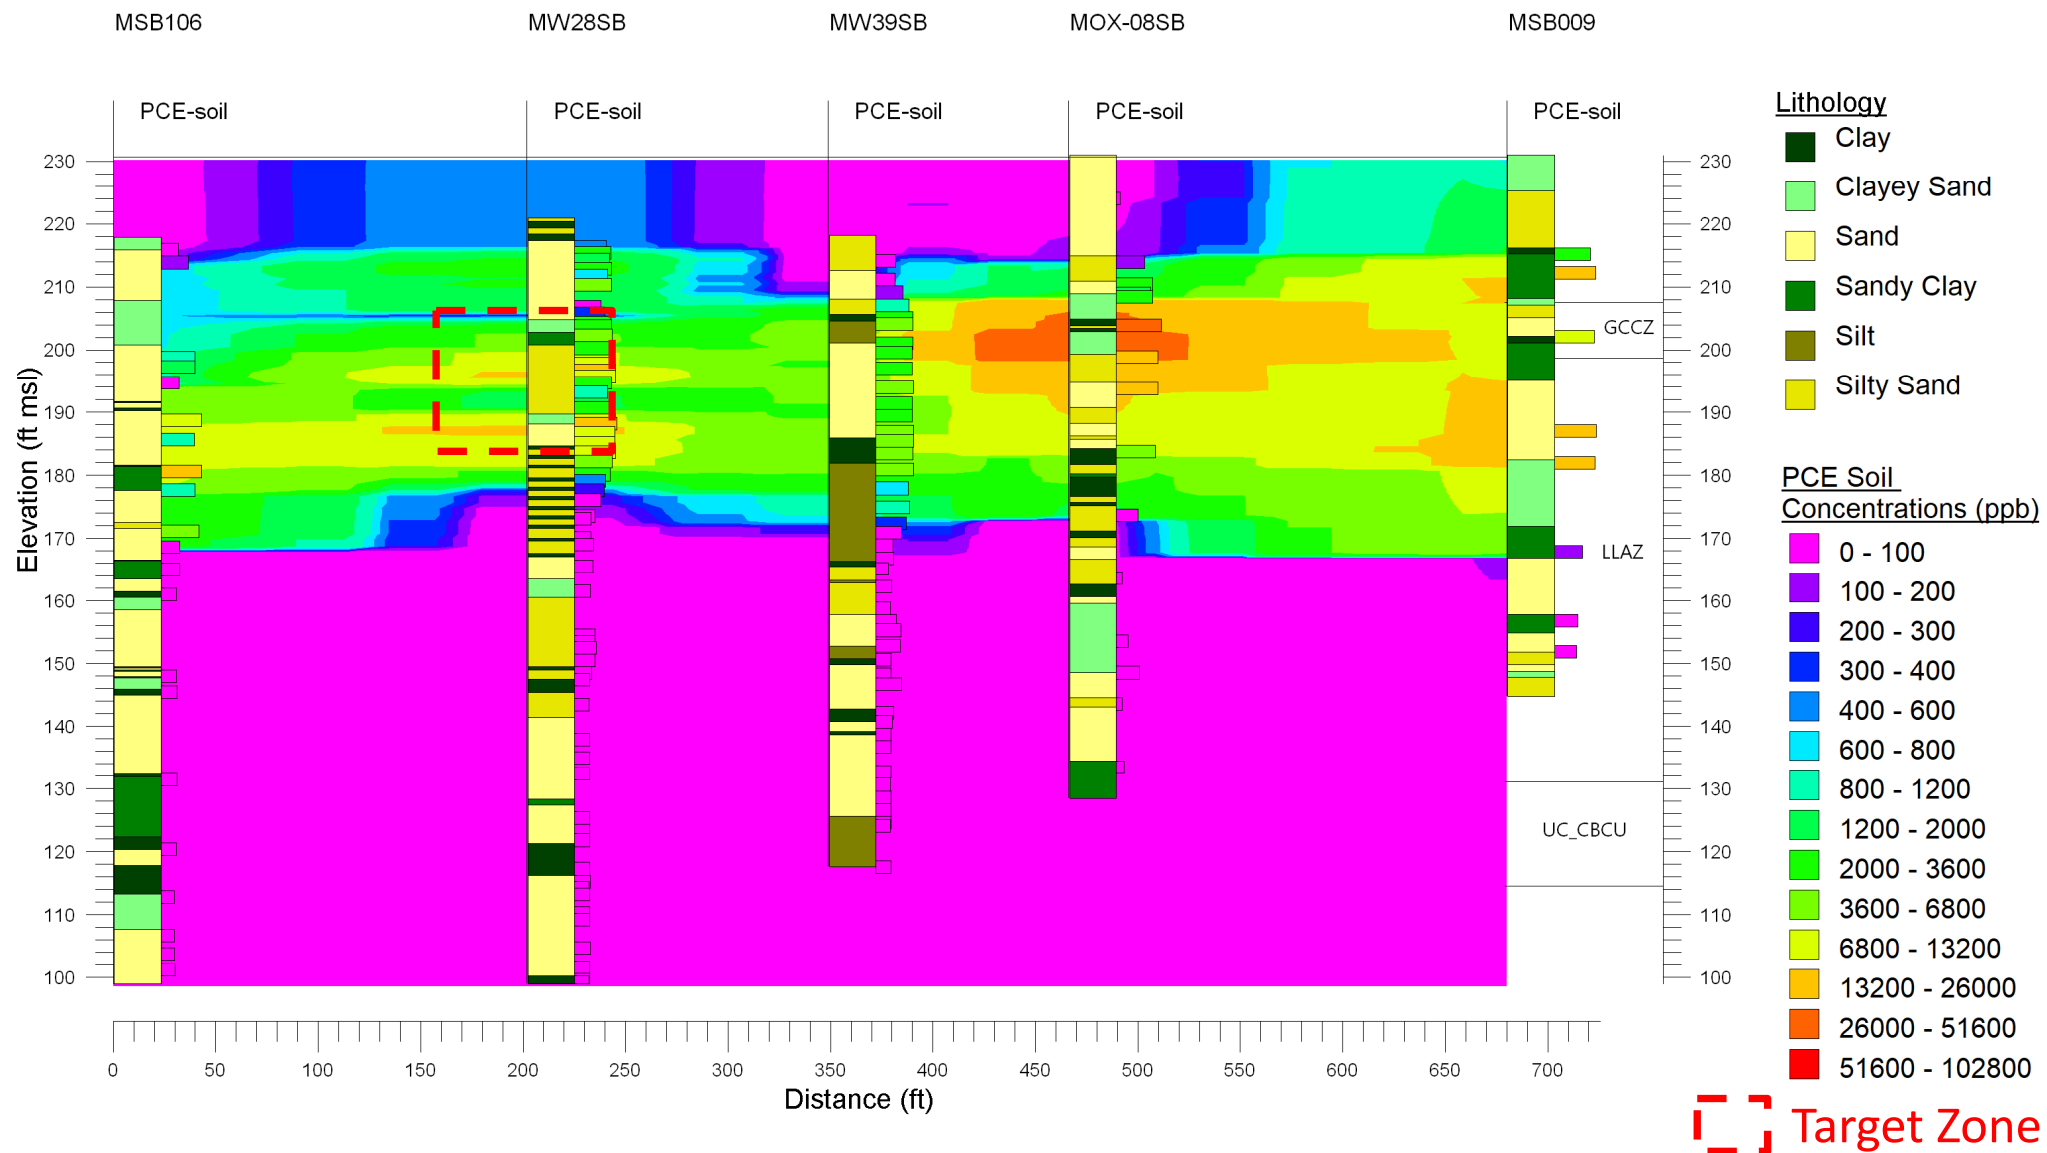

TA Northwest of MASB Soil Investigation (Continued/End)

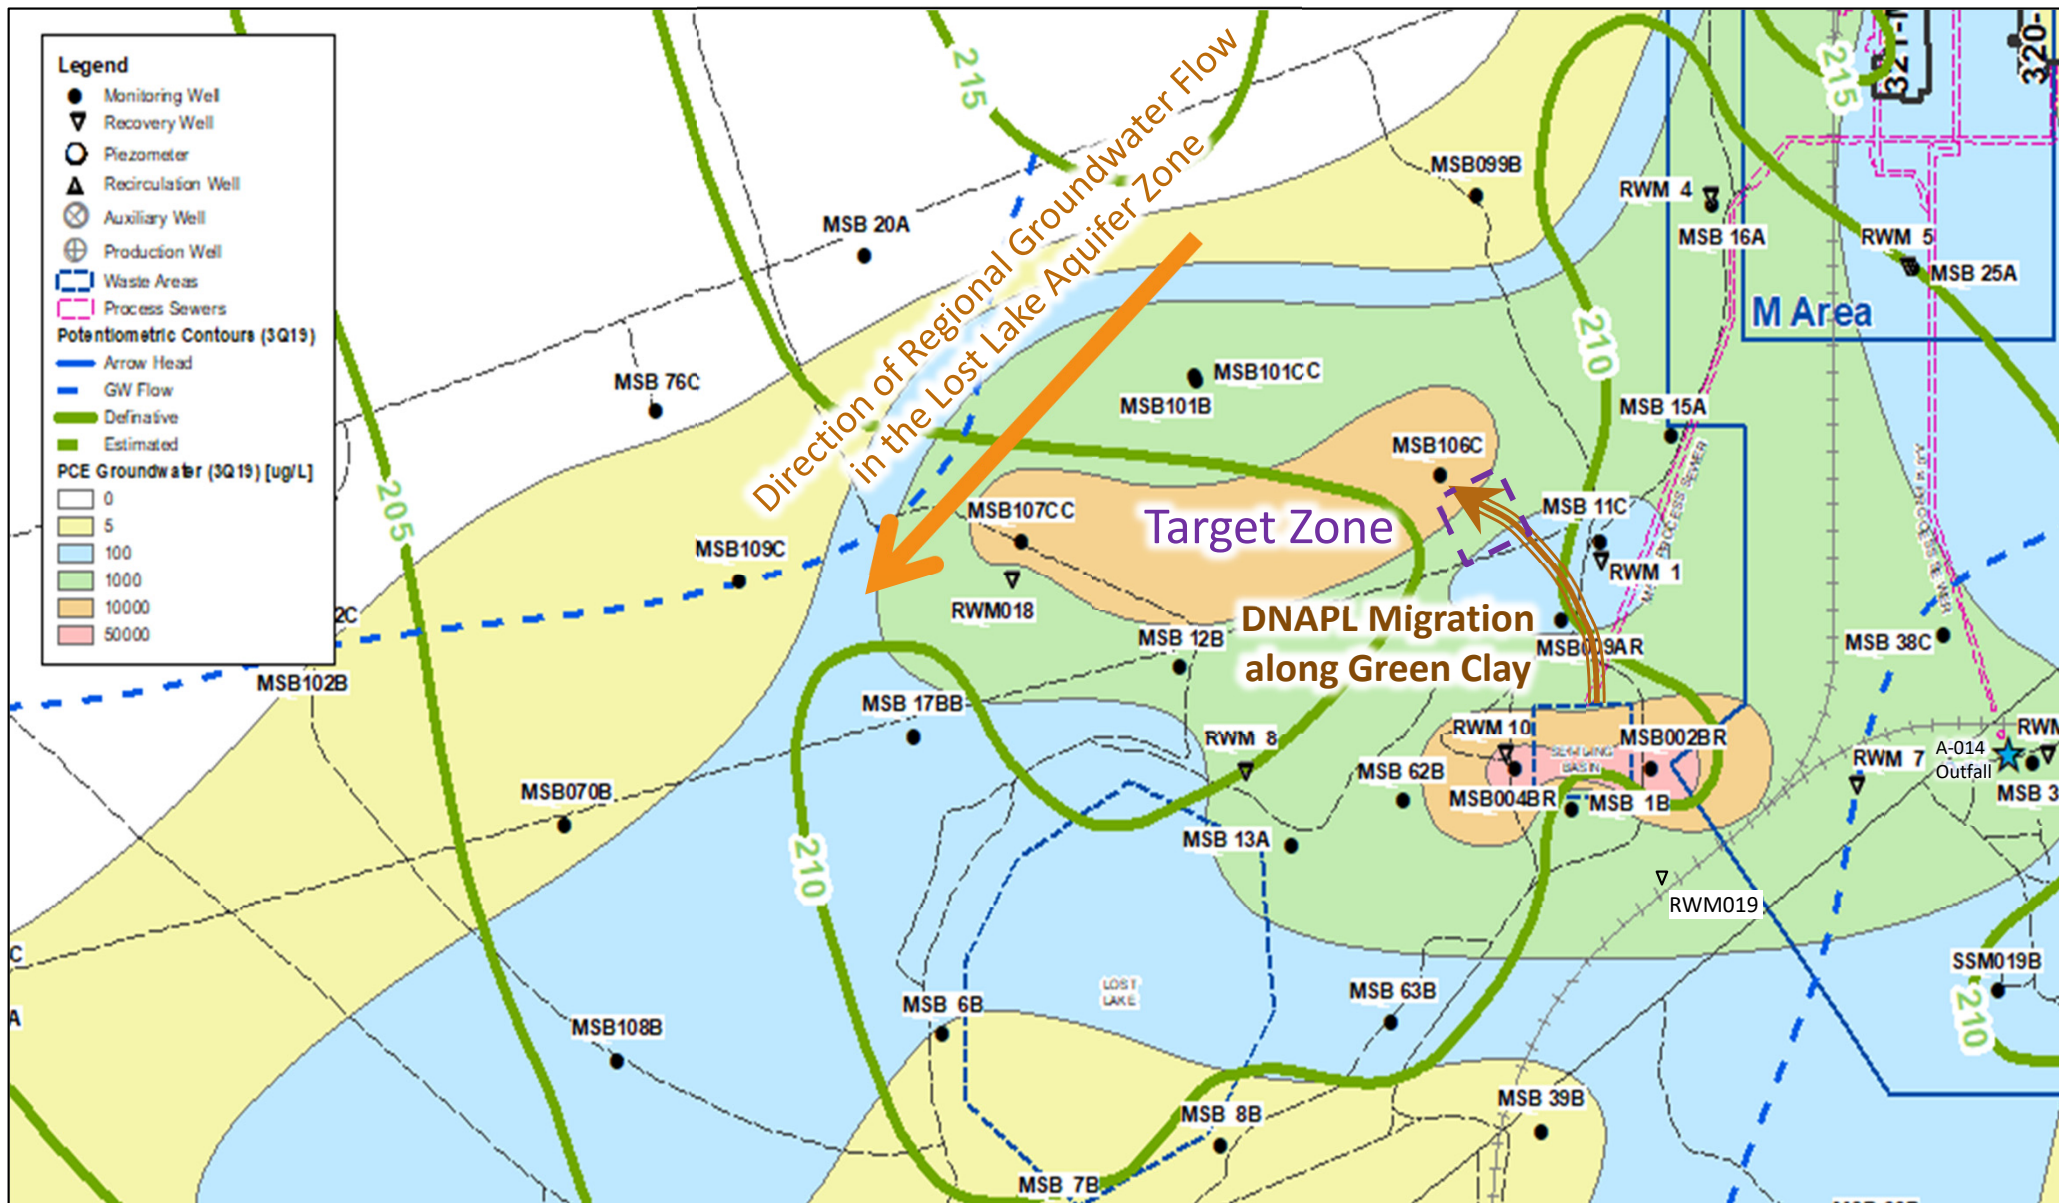

Lithology Cross-Section Between MSB009 and MSB106

PCE Soil Concentration Cross-Section Between MSB009 and MSB106

Composite Lost Lake Aquifer PCE Plume

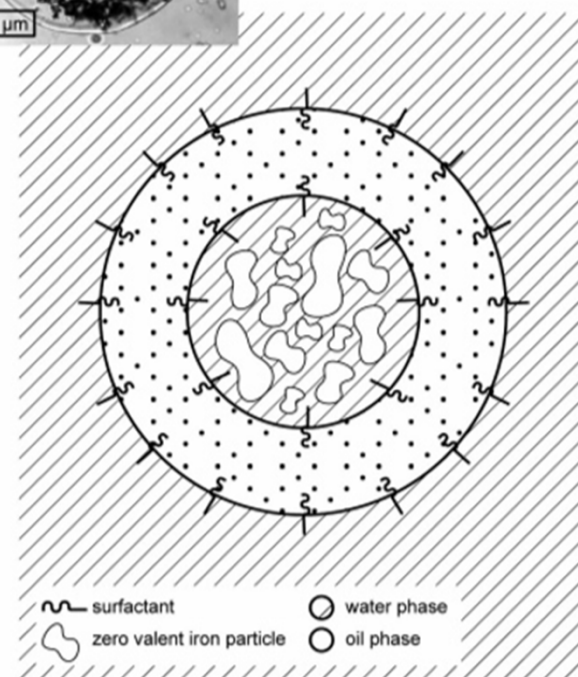

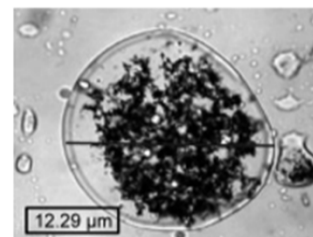

Summary of VOC Contamination in the TA Target Area

- **High levels of VOC contamination exists between the MASB and the MSB106 well cluster**
 - Average combined VOC concentrations of 15 mg/kg in soil
 - Estimated combined VOC concentrations of 30 mg/L in groundwater
- **Based on recent soils data, the highest VOC concentrations are in the Green Clay Confining Zone (GCCZ) and the Upper Lost Lake Aquifer Zone (ULLAZ)**
 - ULLAZ is 15-20 feet thick - fine sand and silty sand
 - GCCZ is 5-10 feet thick - silt, clay and clayey sand
- **No primary localized groundwater flow direction**
- **Objective:** Implement an effective EZVI remedial technology to remove residual DNAPL in the subsurface
 - This is a pilot scale field study that could be scaled up if effective
 - Results of this TA will be used with the other TA results to develop the Corrective Measures Study and the final Corrective Action Plan for Western Sector

Proposed In-Situ Remedial Technology for TA

- **Proposed technology is EZVI using micro-scale ZVI**
 - Consists of micro-scale ZVI particles coated in an emulsified edible oil
 - VOCs preferentially partition into the oil phase of the edible oil
 - ZVI degrades chlorinated VOCs through reductive dechlorination
 - Enhanced conditions for microbial activity
 - *Edible oil carbon source*
 - *Reductive conditions created by ZVI*

Quinn et al., Environ. Sci. Technol., 2005, 39, 5, 1309-1318.

Proposed In-Situ Remedial Technology for TA (Continued/End)

• EZVI Case Studies in USEPA Region 4

— Cape Canaveral Air Force Station, Florida (2004)

- *661 gallons of nano-scale EZVI*
- *Unconsolidated, fine sands*
- *Targeting TCE*
- *Estimated 86% reduction in total TCE mass (84% reduction in TCE DNAPL)*

— Parris Island, South Carolina (2006)

- *750 gallons of nano-scale EZVI*
- *Sandy silt, clay, and peat*
- *Targeting PCE*
- *Estimated 86% reduction in total PCE mass (93% reduction in PCE DNAPL)*

Advantages of EZVI

- *DNAPL targeted technology*
- *Long-term biodegradation provided by oil, opportunity for bioaugmentation*
- *Complete reduction to non-toxic end products*
- *Green remedial technology implemented in-situ*

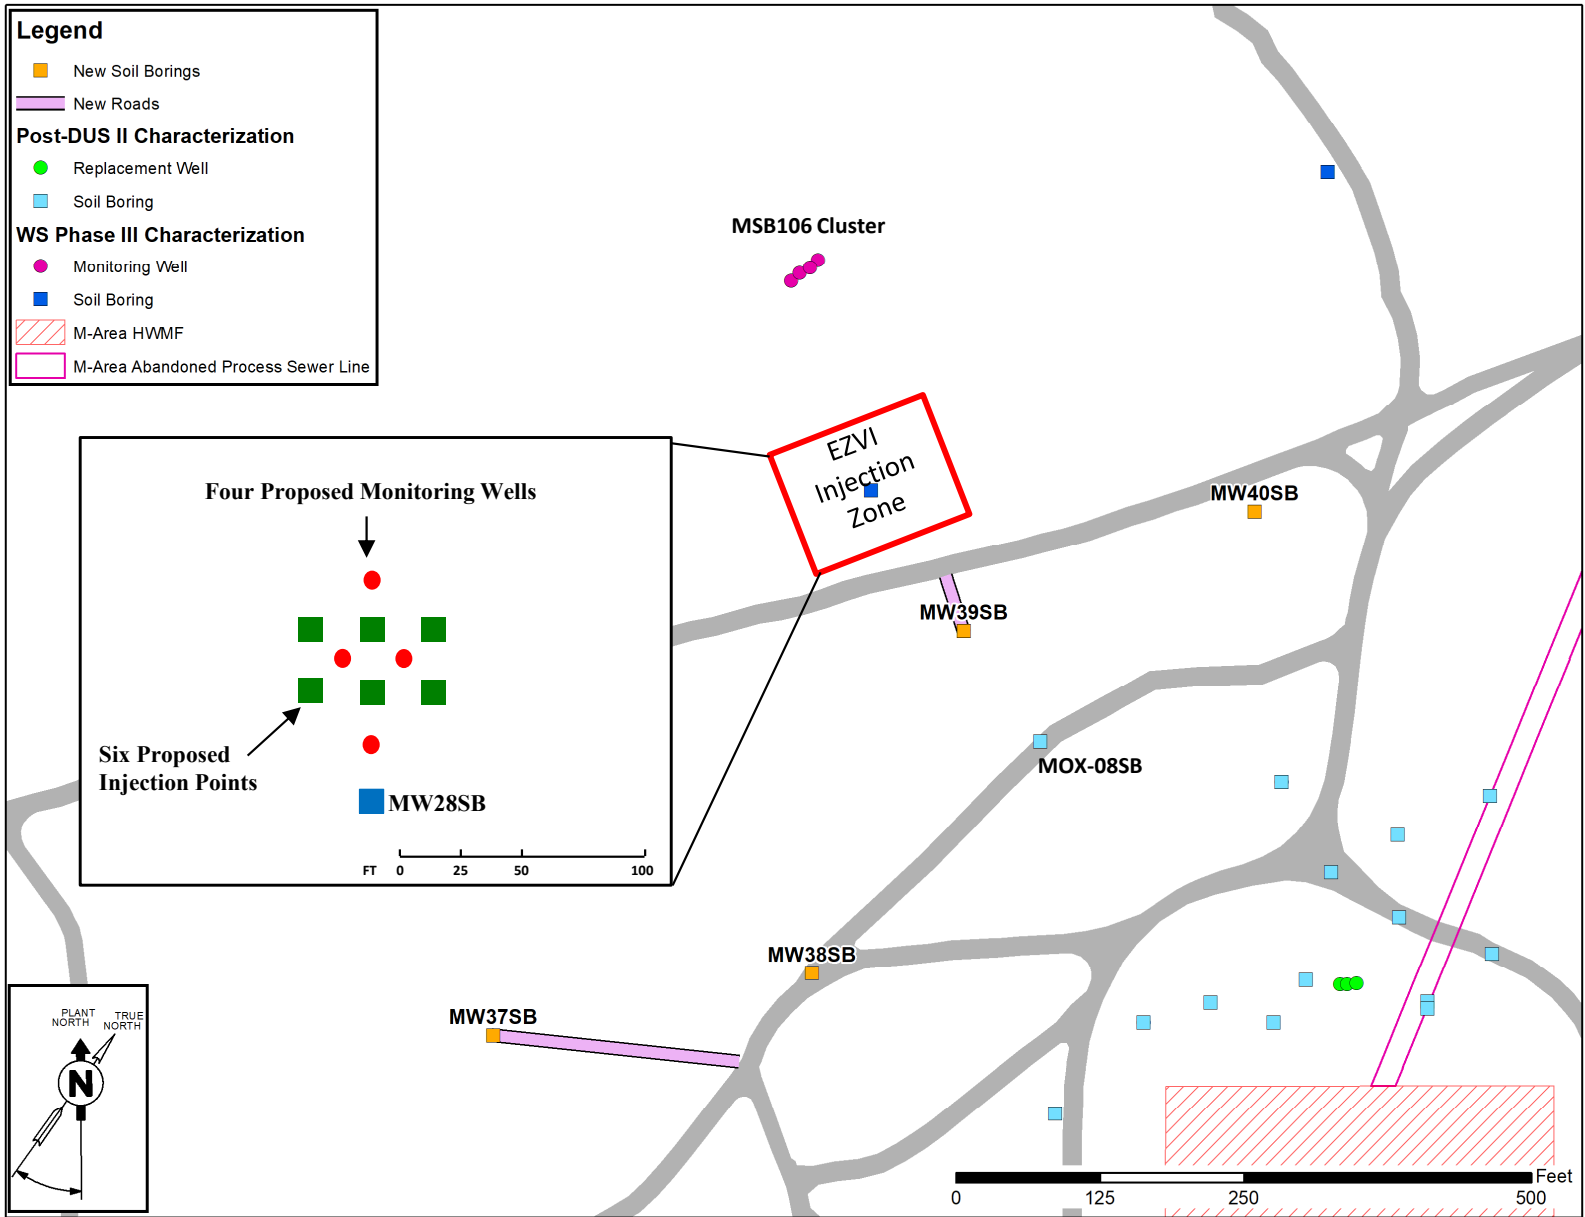

Limitations of EZVI

- *Cost of EZVI can be high*
- *EZVI may be difficult to inject due to high viscosity*
- *Important that EZVI contacts the DNAPL*

EZVI Injection Strategy

- **EZVI mix consists of:**
 - Edible oil (40-60% by weight)
 - Micro-scale ZVI (30-50% by weight)
 - Surfactant and other vendor specific amendments (Balance; ~10% by weight)
- **EZVI diluted with water and injected**
 - Mixing with water allows for even distribution in subsurface
 - Water: EZVI ratio ranges depending on formation (1:1 to 5:1)
 - EZVI volumes range from 10-30% of the pore volume in literature
- **Injections performed using hydraulic fracturing through drill casings**
- **EZVI injections followed by chase water to achieve desired radius of influence**

TA Conceptual Layout

EZVI Remediation Monitoring Strategy

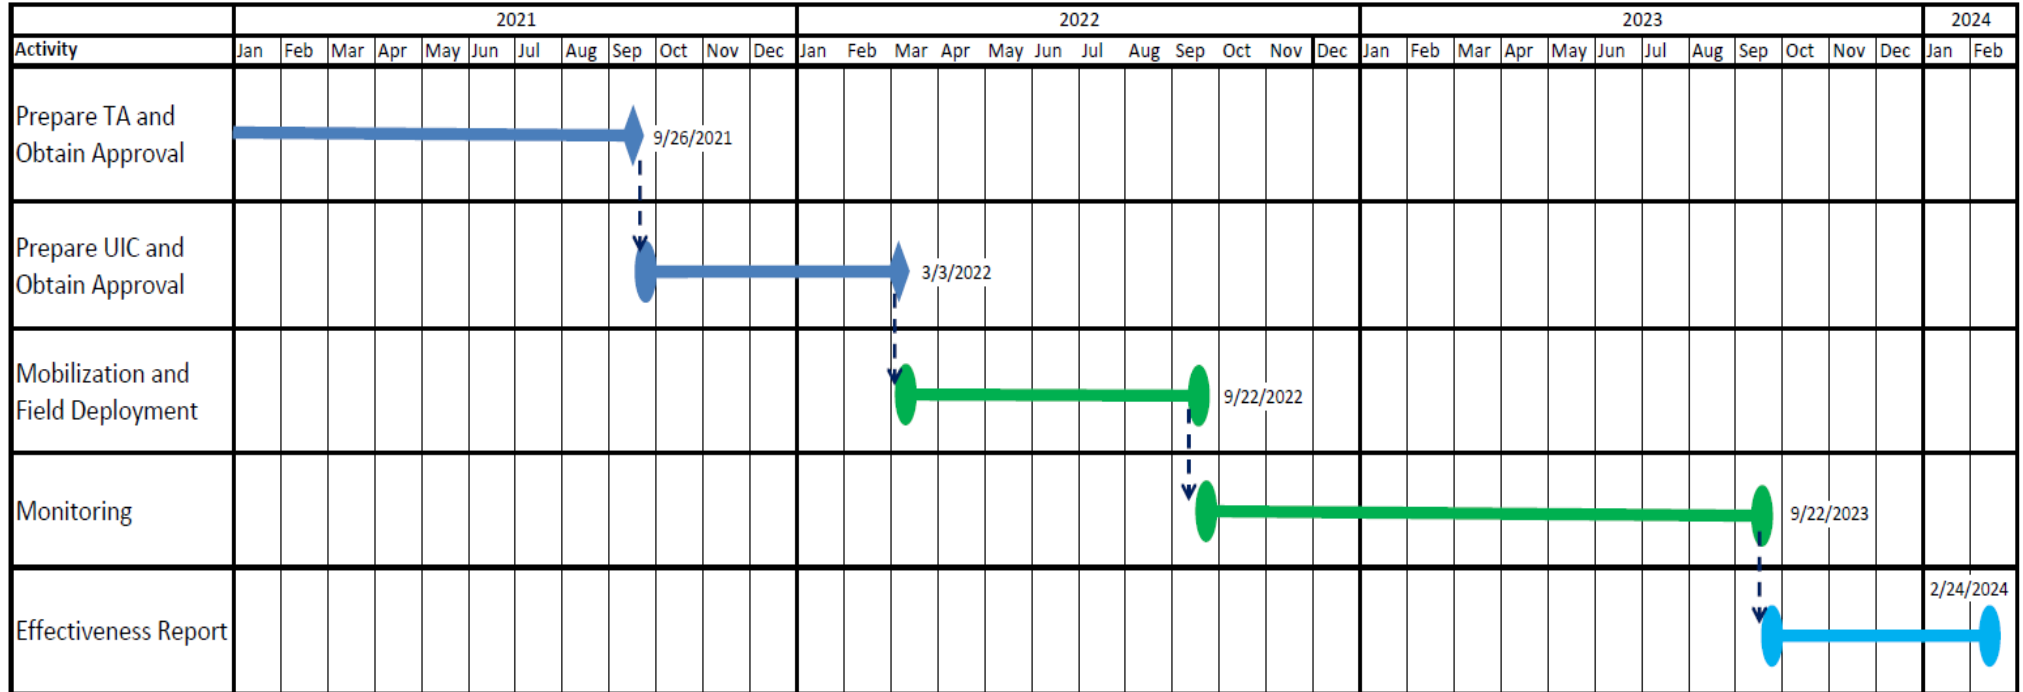

- **One year of monitoring proposed to look at changes in:**
 - VOC concentrations
 - Reductive dechlorination parameters (i.e., pH, DO, and ORP)
 - DNAPL destruction (i.e., chloride and mercury)
 - Iron and Secondary Metals
- **Four new monitoring wells proposed for effectiveness monitoring**
 - Two monitoring wells within the injection zone will provide effectiveness of the technology on VOC degradation
 - Two monitoring wells installed in vicinity of injection area, but outside of injection zone, to assess performance of the technology in decreasing VOC mass flux in the ULLAZ
- **At the conclusion of monitoring, an effectiveness evaluation report will be submitted to report the TA performance monitoring results**

Evaluation on the Impact to the M-1 Air Stripper

- **The evaluation compared performance monitoring data from the P-Area Groundwater Operable Unit Removal Action Zero-Valent Iron Permeable Reactive Barrier (ZVI-PRB) to the limits defined by the M-1 Air Stripper Waste Acceptance Criteria (WAC)**
- **Conclusions from ZVI-PRB monitoring data**
 - pH was elevated within the ZVI-PRB
 - Iron, pH, and secondary metals were elevated ~20-40 ft down-gradient of the ZVI-PRB
 - Elevated concentrations of iron, pH, and secondary metals were not observed in monitoring wells ~125 ft down-gradient of the ZVI-PRB
- **Based on the evaluation, the potential for impact to the M-1 Air Stripper is very low and is not expected. However, out of an abundance of caution, the following additions to the monitoring plan will be added:**
 - Purge water management systems will be installed at each well to avoid exceeding M-1 Air Stripper WAC
 - Contingent monitoring at RWM 8 (~700 ft from TA target) and RWM 10 (~500 ft from TA target) will be conducted if elevated iron, pH, or metal concentrations are observed at the four proposed monitoring wells

Proposed Western Sector TA Strategy and Schedule

Note: The timing of the field deployment is fiscal year funding dependent.
