ACCREDITED GEOSYNTHETICS LABORATORIES

2015 Statement of Qualifications
Geosynthetics Services

TRI is a full service global geosynthetics testing laboratory, unaffiliated with any other engineering/design, manufacturing, installation or distribution firm. TRI has been servicing the geosynthetics industry for over twenty five years. In the context of geosynthetics and construction quality assurance (CQA) project work, TRI provides support in the following ways.

SERVICE AREAS

In-plant Sampling and Inspection Services

While many quality assurance programs involve on-site sampling of product rolls after they arrive, they often result in expensive delays and costly corrections when subsequent testing identifies non- conforming product rolls. TRI was the first to revolutionize this approach by establishing in-plant manufacturing quality assurance (MQA) inspection and sampling services in the locations of product manufacture. These services are now established in the following cities and geosynthetic plants.

Location	Geosynthetic Producer Sampled
Houston, Tx.	GSE Lining Company
Kingstree, SC.	GSE Lining Company
Grand Prairie, Tx.	PolyFlex
Fernley, NV	AGRU America
Georgetown, SC	AGRU America
Greenville, SC	South East Manufacturers (Skaps, Tensar, Tencate, Willacoochee, Thrace-Linq, Crown Resources, PGI, Huesker)
Evergreen, AL	Tenax Corporation
Baltimore, MY	Tenax Corporation
Lovell, WY	CETCO
Fairmount, GA	CETCO
Barrie, Canada	GSE – BentoFix
Spearfish, SD	GSE – Gundseal
Varennes, Canada	SOLMAX

TRI's in-plant services are established in the host-city of the manufacturer of interest, thus eliminating the need for sponsors to pay for travel and lodging costs traditionally associated with MQA inspection and sampling events.

Geosynthetics Conformance/Verification Testing and Laboratory Accreditation

TRI's geosynthetics laboratories and governing quality assurance system are accredited by the Geosynthetics Accreditation Institute (GAI). TRI is proud to be the first testing laboratory to achieve this accreditation, and is currently distinguished as holding the most comprehensive (135 tests) accreditation in the world. TRI has been testing and evaluating geosynthetics materials for over twenty years and has earned a superior reputation as an internationally acclaimed, highest quality testing and research facility. Our staff are active on ASTM's Committee D35 and ISO Committee TC221 for geosynthetics testing, and assure the most up-to-date, state-of- the-art testing systems and standard operating procedures for all sponsored work.

Various test hardware to support this laboratory's activities includes:

- a 600 kN (135,000-pound)capacity long extension Instron model 5889 testing machine equipped with Bluehill 2 "Smart-Data" acquisition system
- a 200 kN (44,962-pound) capacity Instron Model 5585 testing machine equipped with Bluehill 2 "Smart-Data" acquisition system;
- a 150 kN (33,721-pound) capacity Instron Model 5583 testing machine equipped with Bluehill 2 "Smart-Data" acquisition system;
- a 5 kN (1,125-pound) capacity Instron Model 5565 testing machine equipped with Bluehill 2 "Smart- data" acquisition system; fixturing and support apparatus for diversified materials testing;
- a 22,000-pound Instron Servo-Hydraulic Testing Machine with various direct-mounting extensometers;
- 2 five station five-1000-pound load cell, screw-driven testing machines equipped with automatic data acquisition software to test multiple seam samples concurrently;
- load cells and instrumentation for the above with the capability to measure l g - 100,000 lbs in tension or compression;
- durometer hardness testers;
- microtome precision cutting apparatus;
- Mullen Model A burst tester with 2,500 psi capability;
- hydrostatic resistance test apparatus;
- 2 constant and 2 falling head permittivity apparatus;

- 7 hydraulic transmissivity test apparatus;
- 35 hydraulic conductivity test apparatus;
- IBM-PC compatibles equipped with a variety of interfacing, networking and software capability.

Destructive Seam Testing During Installation

During geomembrane installation, most CQA plans include third party destructive seam testing to assure the quality of the welds. TRI may provide this service at a competitive cost and rapid turnaround time. All results of destructive seam tests are provided the same day as sample receipt via facsimile with hard copies mailed the next day. At the end of the project a complete summary of all results is provided for project records. TRI also provides seam forensic capabilities to assist the project if and when any problems are encountered with dirty seams or welds marked by too much or insufficient heat, bad alignment, etc. We may provide microtomes and photographs of observations to assist you in responding appropriately to any quality assurance issue.

Interface Friction/Direct Shear and Related Performance Testing

TRI laboratories perform a variety of performance testing services to support design verification and confirmation of material performance properties. This testing includes interface friction/direct shear testing to investigate slope stability as well as hydraulic conductivity for geosynthetic clay liner materials. TRI employs 15 interface friction boxes facilitating a superb testing turnaround time for the determination of slope stability behavior. We also maintain traditional geotechnical testing capabilities via pinhole dispersion, California bearing ratio, and one-dimensional consolidation. Pinhole dispersion testing provides TRI with capabilities to test for dispersive clays that could be used in earthen dams and levees. California bearing ratio enables TRI to determine subgrade suitability for roads and parking lots. One-dimensional consolidation allows TRI to estimate settlements of earthen structures such as dams and soft soils, which are subject to large overburden pressures. With these test procedures combined with routine triaxial shear strength testing and extensive soil hydraulic conductivity testing, TRI provides all of the testing needed to support major earthwork projects involving geosynthetics.

Also included are durability testing services such as long-term creep and stress-rupture testing, long-term transmissivity, clogging potential, UV resistance, oxidation and hydrolysis resistance, and other related performance evaluations. TRI staff are well versed in design issues and assist our customers in developing and performing responsive performance testing programs.

- 18 uni-axial tension/compression machines for tensile, modulus, compressive strength and related measurements;
- 15 direct shear/interface friction apparatus (12" box; 3-1/2" depth; GeoDurham);
- 7 hydraulic transmissivity frames;
- Environmental chambers and forced air/convection ovens for oxidation resistance testing.
- Q-Panel and Atlas Weatherometers for Xenon arc and QUV ultraviolet light chambers for UV resistance testing.
- Large-scale connection and pull-out test apparatus for testing coefficient of interactions and connection strengths supportive of reinforcement design;
- Long term tension creep/stress rupture test apparatus for conventional characterization of creep reduction factors
- Elevated temperature tension creep/stress rupture test and compressive creep apparatus for accelerated characterization of creep reduction factors. This equipment includes capacity for performance of the Stepped Isothermal Method (SIM).
- gradient ratio and biological clogging test apparatus;
- notched constant load test apparatus capable of testing up to 120 specimens;
- multi-axial tension and large scale hydrostatic puncture test apparatus;
- Full-scale laboratory soils testing equipment (Atterburg limits, grain size, proctor compaction, consolidation, tri-axial shear, permeability, CBR, etc).
- Analytical chemistry equipment (digestion, titration and viscosity apparatus) necessary for molecular weight and carbonyl end group testing of polyester based geogrids.

Research and Development of New Geosynthetic Products

As an independent third party testing facility, TRI is well known for its capability to perform advanced research and development but at a high level of confidentiality. As new geosynthetic products are introduced into the market, their relative performance characteristics are tested and evaluated in the context of product development and definition.

Forensics and Failure Analysis

TRI maintains a broad capability to evaluate the microstructural properties of geosynthetic materials. This capacity, in concert with our performance testing capability, is often employed to investigate the cause for geosynthetic seaming problems or geosynthetic material failures. Senior technical staff bring their experience to bear on specific technical challenges encountered as geosynthetic materials are installed. Forensic

investigation is also called upon when new and/or unknown materials are evaluated, or where premature field failures have occurred.

Specification Review and Product Selection

Within the geosynthetics industry, there is all too often a tendency to mis-specify or over-specify a geosynthetic material. Problems in material specifications often result in an apparent "failure" in material even though the material was never appropriate for the application. Wasted money is often spent on mis- applied materials or laboratory testing that provides no benefit in the context of material quality verification or investigation. In the worst cases, irrelevant specifications often lead to expensive delays in material acquisition and installation.

TRI's technical staff review geosynthetic material specifications to assure their relevancy to the material for which they exist. When product selection questions are defined, TRI's staff assist the client in comparing candidate materials and in formulating responsive testing programs. In addition, TRI staff help develop specifications where none exist or where a new material is proposed for application. Through this work, TRI staff have saved significant money and time for our clients.

Training Services

To assist our clients in maintaining their awareness of continual industry developments, TRI staff routinely provide lectures, workshops and short courses designed to focus on various aspects of geosynthetic materials, testing and specifications. Professional Development Hours (PDHs) are offered for most course offerings. Currently, the following short courses are provided.

- The Testing and Specification of Geomembranes
- Slope Stability and Interface Friction Testing
- The Performance of Site-Specific Liner Integrity Surveys (Electric Leak Surveys)
- The Design, Testing and Specification of Geocomposite Drains
- `GSI CQA Technician Certification - Exam Preparation Course
- Certification for Liner Integrity Surveys
- Green Engineering Using Rolled Erosion Control Products

WEB-SITE AND DATA REPORTING

TRI provides resource information and client reports in client-confidential files on our website:

www.GeosyntheticTesting.com

TRI clients, and their authorized contacts have free use of this web-site via TRI provision of a user-name and password. In addition to faxing and e-mailing completed laboratory test reports, these individual project reports are posted to our web-site for access by all authorized parties. The project-specific data report files are filed by project name making access easy and immediate, facilitating final report download at any time. TRI accreditation documentation, TechNotes (providing answers to typically asked questions), and Test Request Forms are also provided for downloading. In addition, an up-to-date listing of test standards and procedures, to assist in specification development and review, is provided.

CREDENTIALS

TRI has been recognized for over eighteen years as having the industry's most comprehensive accreditation by the Geosynthetic Accreditation Institute (GAI). Indeed, the GAI responds to all geosynthetic tests. The GAI program is based on ISO 10725 and includes associated requirements of quality organization, standard operating procedures, calibration, training, non-compliance records and response, and continual quality improvement measures. However, most significantly, accreditation is granted per test. That is, each test procedure is inspected for compliance to governing standards. In addition, each year the accreditation is validated via proficiency testing whereby "unknown" materials are tested and results are submitted for direct comparison to established "correct" results developed through statistical analysis. Therefore, proficiency tests are graded to statistical norms.

TRI is also accredited by the Army Corp of Engineers and the Louisiana Department of Environmental Protection for geosynthetic testing. It is also noted here that TRI good practices and laboratory operations are governed by ISO 10725 and have been audited by AMRL (AASHTO) insofar as sample receipt, archive and sample preparation procedures. The GAI and AMRL auditing functions inspect similar sample management procedures in this regard.

TRI appreciates your interest and values each opportunity to serve you. As always, please call if we may answer any questions or provide any additional information (1-800-880-8378) or E-mail SAllen@tri-env.com or JDettman@tri-env.com.

Re: GAI-LAP Accreditation

Dear Mr. Nelson,

The Geosynthetic Institute (GSI) is pleased to acknowledge TRI/ Environmental Inc. on its repertoire of Geosynthetic Accreditation Institute's-Laboratory Accreditation Program (GAI-LAP) accredited tests. This letter should serve as notification that TRI/Environmental Inc. located in Austin, TX is currently accredited for the following one hundred and sixty test methods until June 30, 2016.

1. ASTM D413 Test Methods for Rubber Property-Adhesion to Flexible Substrate
2. ASTM D570 Test Method for Water Absorption of Plastics
3. ASTM D638 Test Method for Tensile Properties of Plastics
4. ASTM D696 Test Method for Coefficient of Linear Thermal Expansion of Plastics
5. ASTM D737 Test Method for Air Permeability of Textiles
6. ASTM D746 Test Method for Brittleness Temperature of Plastics and Elastomers by Impact
7. ASTM D751 Test Methods for Coated Fabrics (thickness), (mass/unit area), (tongue tear), (grab), (hydrostatic resistance) and/or (bonded seam strength)
8. ASTM D790 Test Method for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials
9. ASTM D792 Test Method for Specific Gravity (Relative Density) and Density of Plastics by Displacement
10. ASTMD882 Test Methods for Tensile Properties of Thin Plastic Sheeting (strip tensile)
11. ASTM D1004 Test Method for Initial Tear Resistance of Plastic Film and Sheeting
12. ASTM D1203 Test Method for Volatile Loss from Plastics Using Activated Carbon Methods
13. ASTM D1204 Test Method for Linear Dimensional Changes of Nonrigid Thermoplastic Sheeting or Film at Elevated Temperature
14. ASTM D1238 Test Method for Flow Rates of Thermoplastics by Extrusion Plastometer
15. ASTM D1388 Test Method for Stiffness of Fabrics

16. ASTM D1505 Test Method for Density of Plastics by the Density-Gradient Technique
17. ASTM D1593 Specification for Nonrigid Vinyl Chloride Plastic Sheeting (thickness)
18. ASTM D1603 Test Method for Carbon Black in Olefin Plastics
19. ASTM D1621 Test Method for Compressive Properties of Rigid Cellular Plastics
20. ASTM D1693Test Method for Environmental Stress-Cracking of Ethylene Plastics
21. ASTM D1709 Standard Test Methods for Impact Resistance of Plastic Film by the Free-Falling Dart Method
22. ASTM D1777 Test Method for Measuring Thickness of Textile Materials
23. ASTM D 1790 Brittleness Temperature by Impact (PVC)
24. ASTM D1822 Standard Test Method for Tensile-Impact Energy to Break Plastics and Electrical Insulating Materials
25. ASTM D1922 Standard Test Method for Propagation Tear Resistance of Plastic Film and Thin Sheeting by Pendulum Method
26. ASTM D1987 Test Method for Biological Clogging of Geotextile or Soil Geotextile Filters
27. ASTM D2122 Test Method for Determining Dimensions of Thermoplastic Pipe and Fittings
28. ASTM D2136 Test Method for Coated Fabrics-Low Temperature Bend Test
29. ASTM D2240 Test Method for Measuring Durometer Hardness
30. ASTM D2256 Standard Test Method for Tensile Properties of Yarns by the Single-Strand Method
31. ASTM D2412 Test Method for Determination of the External Loading Characteristics of Plastic Pipe by Parallel-Plate Loading
32. ASTM D2444 Test Method for Determination of the Impact Resistance of Thermoplastic Pipe Fittings by Means of a Tup (Falling Weight)
33. ASTM D3015 Standard Practice for Microscopic Examination of Pigment Dispersion in Plastic Compounds
34. ASTM D3030 Test Method for Volatile Matter (Including Water) of Vinyl Chloride Resins
35. ASTM D3083 Standard Specification for Flexible Poly (Vinyl Chloride) Plastic Sheeting for Pond, Canal, and Reservoir Lining, (soil burial), (water extraction) and/or (bonded seam strength)
36. ASTM D3350 Specification for Polyethylene Plastic Pipe and Fittings Materials
37. ASTM D3776 Test Method for Mass Per Unit Area (Weight) or Woven Fabric
38. ASTM D3786 Test Method for Hydraulic Burst Strength of Knitted Goods and Nonwoven Fabrics (Diaphragm Bursting Strength Tester Method)
39. ASTM D3787 Test Method for Bursting Strength of Textiles-Constant-Rate-of-Traverse (CRT) Ball Burst Test
40. ASTM D3895 Test Methods for Oxidative-Induction Time of Polyolefins by Differential Scanning Calorimetry
41. ASTM D4218 Test Method for Carbon Black Content in Polyethylene Compounds by the Muffle-Furnace Technique
42. ASTM D4355 Test Method for Determination of Geotextiles from Exposure to Ultraviolet Light and Water (Xenon-Arc Type Apparatus)

43. ASTM D4491 Test Methods for Water Permeability of Geotextiles by Permittivity
44. ASTM D4533 Test Method for Index Trapezoidal Tearing Strength of Geotextiles
45. ASTM D4595 Test Method for Tensile Properties of Geotextiles by the Wide-Width Strip Method
46. ASTM D4603 Test Method for Determining Inherent Viscosity of Poly (Ethylene Terephthalate) (PET)
47. ASTM D4632 Test Method for Grab Breaking Load and Elongation of Geotextiles
48. ASTM D4716 Test Method for Determining the (In-Plane) Flow Rate per Unit Width and Hydraulic Transmissivity of a Geosynthetic Using a Constant Head
49. ASTM D4751 Test Method for Determining Apparent Opening Size of a Geotextile
50. ASTM D4833 Test Method for Index Puncture Resistance of Geotextiles, Geomembranes and Related Products
51. ASTM D4884 Test Method for Seam Strength of Sewn Geotextiles
52. ASTM D4885 Test Method for Determining Performance Tensile Strength of Geomembranes Using Wide Strip Testing
53. ASTM D4886 Test Method for Abrasion Resistance of Geotextiles (Sand Paper/Sliding Block Method)
54. ASTM D5035 Test Method for Breaking Strength and Elongation of Textile Fabrics (Strip Method)
55. ASTM D5101 Test Method for Measuring the Soil-Geotextile System Clogging Potential by the Gradient Ratio
56. ASTM D5199 Test Method for Measuring Nominal Thickness of Geotextiles and Geomembranes
57. ASTM D5261 Test Method for Measuring Mass per Unit Area of Geotextiles
58. ASTM D5262 Test Method for Evaluating the Unconfined Tension Creep Behavior of Geosynthetics
59. ASTM D5321 Test Methods for Determining the Coefficient of Soil and Geosynthetic or Geosynthetic and Geosynthetic Friction by the Direct Shear Method,
60. ASTM D5322 Standard Practice for Immersion Procedures for Evaluating the Chemical Resistance of Geosynthetics to Liquids
61. ASTM D5323 Determination of 2% Secant Modulus for Polyethylene Geomembranes
62. ASTM D5397 Test Method for Evaluation of Stress Crack Resistance of Polyolefin Geomembranes using Notched Constant Tension Load Test
63. ASTM D5493 Test Method for the Permittivity of Geotextiles Under Load
64. ASTM D5494 Test Methods for the Determination of Pyramidal Puncture Resistance of Unprotected and Protected Geomembranes
65. ASTM D5514 Test Method for Large Scale Hydrostatic Puncture Testing of Geosynthetics
66. ASTM D5596 Test Methods for Microscopic Evaluation of the Dispersion of Carbon Black in Polyolefin Geosynthetics
67. ASTM D5617 Test Methods for Multi-Axial Tension Test for Geosynthetics
68. ASTM D5721 Standard Practice for Air-Oven Aging of Polyolefin Geomembranes
69. ASTM D5747 Standard Practice for Tests to Evaluate the Chemical Resistance of Geomembranes to Liquids

70. ASTM D5818 Standard Practice for Obtaining Samples of Geosynthetics from a Test Section for Assessment of Installation Damage
71. ASTM D5884 Test Method for the Tearing Strength of Internally Reinforced Geomembranes
72. ASTM D5885 Standard Test Method for Oxidative Induction Time of Polyolefin Geosynthetics by High-Pressure Differential Scanning Calorimetry
73. ASTM D5887 Standard Test Method for Measurement of Index Flux Through Saturated Geosynthetic Clay Liners Specimens Using a Flexible Wall Permeameter
74. ASTM D5890 Standard Test Method for Swell Index of Clay Mineral Component of Geosynthetic Clay Liners
75. ASTM D5891 Standard Test Method for Fluid Loss of Clay Component of Geosynthetic Clay Liners
76. ASTM D5993 Test Method for Measuring the Mass Per Unit Area of GCL
77. ASTM D5994 Test Method for Measuring the Core Thickness of Textured Geomembranes
78. ASTM D6140 Test Method for Determine of Asphalt Retention of Paving Fabrics Used in Asphalt Paving for Full Width Applications
79. ASTM D6213 Standard Practice for Tests to Evaluate the Chemical Resistance of Geogrids to Liquids
80. ASTM D6214 Test Method for Determining the Integrity of Field Seams Used in Joining Geomembranes by Chemical Fusion Methods
81. ASTM D6241 Test Method for the Static Puncture Strength of Geotextiles and Geotextile Related Products Using a 50-mm Probe
82. ASTM D6243 Test Method for Determine the Internal and Interface Shear Resistance of Geosynthetic Clay Liners by the Direct Shear Method
83. ASTM D6364 Test Method for Determining the Short-Term Compression Behavior of Geosynthetics
84. ASTM D6389 Standard Practice for Tests to Evaluate the Chemical Resistance of Geotextiles to Liquids
85. ASTM D6392 Standard Test Method for Determining the Integrity of Nonreinforced Geomembrane Seams Produced Using Thermo-Fusion Methods
86. ASTM D6454 Standard Test Method for Determining the Short-Term Compression Behavior of Turf Reinforcement Mats (TRMs)
87. ASTM D6475 Test Method for Measuring Mass Per Unit Area of Erosion Control Blankets
88. ASTM D6496 Test Method for Determining the Average Bonding Peel Strength Between Top and Bottom Layers of Needle-Punched Geosynthetic Clay Liners
89. ASTM D6524 Test Method for Measuring Resiliency of Turf Reinforcement Mats (TRMs)
90. ASTM D6525 Test Method for Measuring Nominal Thickness of Permanent Erosion Control Products
91. ASTM D6566 Test Method for Measuring Mass per Unit Area of Turf Reinforcement Mats (TRMs)
92. ASTM D6567 Test Method for Measuring Light Penetration of Turf Reinforcement Mat (TRM)

93. ASTM D6574 Test Method for Determining the In-plane Hydraulic Transmissivity of a Geosynthetic by Radial Flow
94. ASTM D6575 Test Method for Determining Stiffness of Geosynthetics used as Turf Reinforcement Mats
95. ASTM D6636 Test Method for Determination of Ply Adhesion Strength of Reinforced Geomembranes
96. ASTM D6637 Test Method for Determining Tensile Properties of Geogrids by the Single or Multi-Rib Tensile Method
97. ASTM D6638 Test Method for Determining Connection Strength Between Geosynthetic Reinforcement and Segmental Concrete Units (Modular Concrete Blocks)
98. ASTM D6693 Test Method for Determining Tensile Properties of Nonreinforced Polyethylene and Nonreiforced Flexible Polypropylene Geomembranes
99. ASTM D6706 Test Method for Determining Pull-Out Resistance of Geosynthetics
100. ASTM D6766 Test Method for Evaluation of Hydraulic Properties of Geosynthetic Clay Liners Permeated with Potentially Incompatible Liquids
101. ASTM D6767 Test Method for Pore Size Characteristics of Geotextiles by Capillary Flow Test
102. ASTM D6768 Test Method for Tensile Strength of Geosynthetic Clay Liners
103. ASTM D6818 Test Method for Ultimate Tensile Properties of Turf Reinforcement Mats
104. ASTM D 6916 Geogrid Pull-out from Segmental Concrete walls.
105. ASTM D6918 Standard Test Method for Testing Vertical Strip Drains in the Crimped Condition
106. ASTM D6992 Test Method for Time-Temperature Superposition Using Stepped Isothermal Method
107. ASTM D7003 Test Method for Strip Tensile Properties of Reinforced Geomembranes
108. ASTM D7004 Test Method for Grab Tensile Properties of Reinforced Geomembranes
109. ASTM D7005 Test Method for Determining the Bond Strength (Ply Adhesion) of Geocomposites
110. ASTM D7056 Test Method for Determining the Tensile Shear Strength of Prefabricated Bituminous Geomembrane Seams
111. ASTM D7101 Test Method for RECP slope
112. ASTM D7179 Test Method for Determining Geonet Breaking Force
113. ASTM D7207 Test Method for RECP shear
114. ASTM D7238 Standard Test Method for Effect of Exposure of Unreinforced Polyolefin Geomembrane Using Fluorescent UV Condensation Apparatus
115. ASTM D7272 Test Method for Determining the Integrity of Seams Used in Joining Geomembranes by Pre-manufactured Taped Methods
116. ASTM D7275 Test Method for Tensile Properties of Bituminous Geomembranes (BGM)
117. ASTM D7322 Test Method for RECP germination
118. ASTM D7361 Test Method for Compressive SIM

119. ASTM D7406 Test Method for Time-Dependent (Creep) Deformation Under Constant Pressure for Geosynthetic Drainage Products
120. ASTM D7409 Test Method for CEG of PET
121. ASTM D 7447 RGM-Seams Strip Method
122. ASTM D 7448 Flexural Rigidity of Geogrid
123. ASTM D 7449 RGM-Seams - Grab Method
124. ASTM D7466 Test Method for Asperity Height
125. ASTM D 7737 Junction Strength Geogrid
126. ASTM E96 Test Method for Water Vapor Transmission of Materials
127. ASTM F904 Test Method for Comparison of Bond Strength or Ply Adhesion of Similar Laminates Made from Flexible Materials
128. ASTM F1249 Standard Test Method for Water Vapor Transmission Rate Through Plastic Film and Sheeting Using a Modulated Infrared Sensor
129. ASTM F1473 Test Method for Notched Tensile Test to Measure the Resistance to Slow Crack Growth of Polyethylene Pipes and Resins
130. ASTM F2136 Test Method for Notched, Constant-Ligament-Stress (NCLS) Test to Determine Slow Crack-Growth Resistance of HDPE Resins and HDPE Corrugated Pipe
131. FTM STD. No. 101c(method 2065-82), Puncture Resistance and Elongation Test (1/8 in. radius probe)
132. GRI GG-1 Geogrid Rib Tensile Strength
133. GRI GG-2 Geogrid Junction Strength
134. GRI GG-7 Carboxyl End Group Content of PET Yarns
135. GRI GG-8 Determination of the Number Average Molecular Weight of PET Yarns Based on Relative Viscosity Value
136. GRI GM-11 Accelerated Weathering of Geomembranes Using a Fluorescent UVA Device
137. GRI GS-7 Determining the Index Friction Properties of Geosynthetics
138. ISO 527 Plastics – Determination of Tensile properties – Part 3: Test conditions for films and sheets
139. ISO 9863 Thickness
140. ISO 9864 Geotextiles - Determination of mass per unit area
141. ISO 10319 Geotextiles - Wide width tensile test
142. ISO 10321 Wide Width Seams
143. ISO 10722 Geotextiles and geotextiles - related products – Procedure for simulating damage during installation Part 1: Installation in granular materials
144. ISO 11058 Geotextiles and geotextile-related products -- Determination of water permeability characteristics normal to the plane, without load
145. ISO 12225 Geotextiles and geotextiles - related products – Screening test method for determining the resistance to microbiological degradation
146. ISO 12236 Geotextiles and geotextiles - related products – Static puncture test (CBR test)
147. ISO 12447 Geotextiles and geotextiles - related products – Screening test method for determining the resistance to hydrolysis
148. ISO 12956 Geotextiles and geotextiles - related products – Determination of the characteristic opening size

149. ISO 12957 Geosynthetics – Determination of friction characteristics Part 1: Direct shear test, Part 2: Inclined plane test
150. ISO 12958 Geotextiles and geotextiles - related products – Determination of water flow capacity in their plane
151. ISO 12960 Geotextiles and geotextiles - related products – Screening test method for determining the resistance to liquids
152. ISO 13426 Geotextiles and geotextiles - related products – Strength of internal structural junctions – Part 1: Geocells Part 2: Geocomposites
153. ISO 13431 Geotextiles and geotextiles – related products - Determination of the tensile creep and creep rupture behavior
154. ISO 13433 Geosynthetics -- Dynamic perforation test (cone drop test)
155. ISO 13438 Geotextiles and geotextiles - related products – Screening test method for determining the resistance to oxidation
156. ISO 13934 Textiles -- Tensile properties of fabrics -- Part 1: Determination of maximum force and elongation at maximum force using the strip -- Part 2: Determination of maximum force using the grab method

Reply to the Attention of:
Concrete and Materials Branch

John M. Allen, PE
TRI Environmental, Inc.
9063 Bee Caves Road
Austin, TX 78733

Dear Mr. Allen:

In reference to your check no. 020039, dated June 6, 2014, and audit agreement, dated June 12, 2014, an audit based on your AASHTO Accreditation was performed on documents submitted by your laboratory. We examined the AMRL On-site Assessment Report No. 1733D, dated December 14, 2013 and the AASHTO accreditation certificate effective July 11, 2014.

Your Quality System meets the requirements of the U.S. Army Corps of Engineers. The material test methods that you are validated to perform for the U.S. Army Corps of Engineers were determined from the inspection reports from AASHTO and are as follows:

Aggregate Tests: ASTM C117, C127, C128, C136, C566, D2419, and D4791.

Geosynthetic Tests: ASTM D413, D570, D638, D696, D737, D746, D751, D790, D792, D882, D1004, D1203, D1204, D1238, D1388, D1505, D1593, D1603, D1621, D1693, D1709, D1777, D1790, D1822, D1922, D1987, D2122, D2136, D2240, D2256, D2412, D2444, D3015, D3030, D3083, D3350, D3776, D3786, D3787, D3895, D4218, D4355, D4491, D4533, D4595, D4603, D4632, D4716, D4751, D4833, D4884, D4885, D4886, D5035, D5101, D5199, D5261, D5262, D5321, D5322, D5323, D5397, D5493, D5494, D5514, D5596, D5617, D5721, D5747, D5818, D5884, D5885, D5887, D5890, D5891, D5993, D5994, D6140, D6213, D6214, D6241, D6243, D6364, D6389, D6392, D6454, D6475, D6496, D6524, D6525, D6566, D6567, D6574, D6575, D6636, D6637, D6638, D6693, D6706, D6766, D6767, D6768, D6818, D6916, D6918, D6992, D7003, D7004, D7005, D7056, D7101, D7179, D7207, D7238, D7272, D7275, D7322, D7361, D7406, D7409, D7447, D7448, D7449, D7466, D7737, E96, F904, F1249, F1473, F2136, FTM STD No. 101c, GRI GG-1, GRI GG-2, GRI GG-7, GRI GG-8, GRI GM-11, GRI GS-7, ISO 527, ISO 9863, ISO 9864, ISO 10319, ISO 10321, ISO 10722, ISO 11058, ISO 12225, ISO 12236, ISO 12447, ISO 12956, ISO 12957, ISO12958, ISO 12960, ISO 13426, ISO 13431, ISO 13433, ISO 13438, ISO 13934, EN 12224, EN 14030, Federal Waterway Engineering & Research Institute (BAW) RPG—Guidelines for Testing Geotextiles for Navigable Waterways: Section 3.11 Abrasion Resistance, and CAN/CGSB-148.1.

Soil Tests: ASTM D421, D422, D698, D854, D1140, D1557, D1883, D2166, D2216, D2419, D2434, D2435, D2487, D2488, D2850, D2974, D3080, D3740, D4318, D4546, D4643, D4644, D4718, D4767, D4829, D4943, D4972, D5084, D7012, and E329.

We will add your laboratory to the list of commercial laboratories qualified to conduct material tests for the U.S. Army Corps of Engineers; see the Materials Testing Center homepage at www.erdc.usace.army.mil/Media/FactSheets/FactSheetArticleView/tabid/9254/Article/476661/materials-testing-center.aspx. All Corps offices will be notified of this decision and will have the opportunity to use your services. TRI Environmental, Inc., Austin, TX will remain on our list of laboratories qualified to conduct material tests until **July 11, 2016** two (2) years from the date of the audit. In the event your AASHTO accreditation is suspended in whole or part, TRI Environmental, Inc., Austin, TX is to notify the Materials Testing Center immediately to perform a re-evaluation of your laboratory's validation. Failure to notify the Materials Testing Center will result in immediate suspension of your U.S. Army Corps of Engineers validation.

Sincerely,

Alfred B. Crawley, PE
Director, Materials Testing Center

AGRU AMERICA, INC. - QA/QC

Manufacturing – Quality Assurance/Quality Control

AGRU AMERICA, Inc. extrudes high density polyethylene (HDPE) and linear low density polyethylene (LLDPE) geomembrane, Geosynthetic Clay Liners (GCL), HDPE Geonet, PP Geotextile and Geocomposite products at its three production plants located at 500 Garrison Road, Georgetown, South Carolina, 29440, 181 Hwy 521, Andrews, South Carolina, and 2000 East Newlands Drive, Fernley, Nevada, 89408.

Our USA Manufacturing Quality Assurance Program is dependent on the utilization of in-house laboratories in each plant which are, when necessary, complemented with testing performed by certified outside laboratories such as:

- Precision Geosynthetic Laboratories; Anaheim, CA
  Telephone (714) 520-9631; Fax (714) 520-9637
- TRI/Environmental, Inc.; Austin, Texas
  Telephone (512) 263-2101; Fax (512) 263-2558

  And other GRI-LAP accredited laboratories.

Raw Material – Manufacturer's Certificate of Conformity

Geotextiles and bentonite are used in the manufacture of geosynthetic clay liners:

- Prior to shipment, our bentonite supplier submits a certificate of analysis. Once approved, the bentonite is released for shipment to our plant.
- At least weekly one sample is taken from a rail car after arrival and tested as follows:
  Swell Index ASTM D5890, Fluid Loss ASTM D5891, Moisture Content ASTM D2216 and particle size ASTM C136.
- The woven geotextile component is manufactured by others and must meet all Agru minimum requirements before it is introduced into the manufacturing process.
- The nonwoven geotextile is made by Agru or by others. In either case, it is tested to assure it meets our minimum properties before it is introduced into the manufacturing process.
- Off specification bentonite and/or geotextile is returned to the supplier.
- The Manufacturer's moisture content test data is reported on the GCL Quality Certificate.

Geosynthetic Clay Liner (GCL)

The Manufacturing Process

The bentonite is conveyed through a vacuum pump system and flexible hoses to a hopper, gravity feeding the bentonite onto the surface of the lower geotextile. The upper geotextile is then introduced on top of the layer of bentonite. This three layer product (lower textile, bentonite and upper geotextile) then go through a needle board which locks in the bentonite by needle punching textiles from the top layer to the bottom layer and vice versa.

Exiting the needle board, the rolls of finished GCL go through a magnet and needle detection system to ensure that the finished product is needle free. If needles are detected, the roll is tagged for additional inspection.

In addition to a metal detector and alarm, the GCL is also visually inspected to ensure there are no other surface defects as the material travels through the manufacturing process.

A line on either edge of the GCL are placed 6 inches in from the edge. These lines represent the minimum amount of overlap that should be used during installation.

The GCL is wound on a recycled HDPE core having 6" ID (150mm), 7" OD (175mm) and length corresponding to roll width.

Each standard length roll weighs approximately 2,500 – 4,000 pounds (1130-1815 kg). Rolls are placed in UV resistant plastic bags and sealed on the open end to prevent hydration or loss of bentonite.

Post Manufacturing Quality Control

Once start-up conditions are over and commercial manufacturing is initiated, post-production quality control comes into operation. A series of test procedures are performed based upon either our standard frequency of testing (attached), or frequencies required by customer specifications.

A sample approximately 2' by the full width of the GCL is taken from every 40,000 SF (14 rolls). Based on the specified test frequencies, certain specimens are die cut, tested, and the results summarized on the Quality Certificate issued by our Quality Control Department. The certificate is signed electronically by the Quality Control Manager. The Quality Control Manager reports directly to the President of the Company.

Rolls failing to comply with either Customer Project Specifications and/or our own latest revision to our published data sheets are set aside and re-classified as off-spec (Class B rolls).

Quality Certificates are provided for all rolls of GCLs, with the exception of off-spec (Class B rolls).

Sometimes a third party Quality Assurance representative is mandated by the owner of a project to oversee our manufacturing QA. We gladly subscribe to this procedure and make all our records available 24 hours a day for the duration of the mandate.

The following roll identification items are reported in our Quality Certificate:

Roll number

(example) **G13E383069**

G	1 3	E	3 8	3	0	6	9
PLANT ID	**YEAR**	**MACHINE ID**	**WEEK**	**DAY OF WEEK (MONDAY = 1)**	**COUNTER FOR WEEK**		

First digit	Plant (G=Georgetown / F=Fernley)
Second and Third digits	Year (13 = 2013)
Fourth digit	Machine ID
Fifth & Sixth digits	Week in the current year
Seventh digit	day of week (Monday=1, Sunday=7)
Last three digits	counter for the week (starts at 001)

Using the above key:

Roll #G13E383069 was produced in Georgetown, on Liner Machine E on Wednesday in the 38th week in 2013 (9/18/13).

Product Description GCL type: Agru GeoClay

Roll Length & Width in feet / meters

Raw material lot and/or batch number and supplier/product identification (from Resin Manufacturer's Certificate of Analysis – sample attached)

All GCL rolls are labeled as follows:

- roll stickers on the cores for each roll
- roll stickers on the outside of the finished roll
- written (paint pen) roll numbers on each face (flat ends)
- written (paint pen) roll numbers on the outside of the finished roll.

The following test results are reported in the GCL Quality Certificate, derived from our Standard Test Frequency (attached) and/or supplied raw material manufacturer Certificates of Analysis (Tests performed are the latest revisions of the Standards listed):

Test / Method	Results Reported & Modifications to Standard (if any)
Swell Index ASTM D5890	MARV is reported in ml/2 g min **Modification from Standard =**
Fluid Loss ASTM D5891 Textured liner only	%
Bentonite Mass per Unit Area ASTM D5993	lb/ft^2 Mass is reported at zero % moisture in units of lb/ft^2.
Tensile Strength ASTM D6768	lb/in Reported for machine direction only.
Peel strength ASTM D6496	lb/in Reported for machine direction only
Hydraulic conductivity ASTM D5887	cm/sec max. Tested using deaired, deionized water @ 5psi maximum confining stress and 2 psi head pressure.
Index Flux ASTM D5887	m^3/m^2/sec max Tested using deaired, deionized water @ 5psi maximum confining stress and 2 psi head pressure
Internal Shear Strength ASTM D6243	Psf Specimens are hydrated for 24 hours and sheared at 200 psf. Represents typical peak value.

The following Test Methods / Results are not certified by Agru America, as they are not required by the GRI GC3, and are not considered typical MQC tests.

Test / Method	Results Certified
Nominal Thickness ASTM D5199	mils
Index Puncture Resistance ASTM D4833	lbf

ESI: Baton Rouge

Operations Center

Regional offices:
Columbia, SC
Oconomowoc, WI

OUR HISTORY
Founded in 1996.
Full service landfill construction and full service piping company.
Capable of performing civil earthwork construction .
Supply & install leachate collection systems, landfill gas systems and leachate forcemain systems.
A leading geosynthetic installer in the USA.

APPLICATIONS AND SERVICES AREAS ESI WORKS (both LF & Industrial)
Landfill Containment & Capping
Hazardous Waste Containment
Soil Capping Projects
Mining Applications
Tank Farms
Gypsum Stacks
Vapor Barriers
Superfund Sites
Department of Energy Sites (DOE)
US Army Corps of Engineer
Leachate Collection Systems
Leachate Collection Pumping Systems
Manholes, Valve Boxes, Sump Fabrication
Energy Plants
Water Treatment Facilities
Sewage Lagoons
Secondary Containment
Pond Liners
Water Storage Reservoirs
Rain Tarps
Petrochemical Plants
Aquaculture Applications
Paper Mills
Dual Contained Force Main
Riser Pipes

ABOUT US
ESI completes landfill construction, geosynthetic lining systems and multiple HDPE pipe installations with our own forces that operate out of our Baton Rouge, Louisiana operations center.

SAFETY: #1 GOAL
ESI prides itself on its past and current safety record and continually strives to achieve a Zero Accident Rate. ESI's EMR is 0.79

Re: WC Experience Modifiers

Ashton,

Per your request, here are the experience modification rates for Environmental Specialties International, Inc. for the years 2010 – 2014.

4/1/2010	.72
4/1/2011	.72
4/1/2012	.77
4/1/2013	.82
4/1/2014	.79

If you need any further information, please don't hesitate to let me know.

Regards,

Paul R. Owen, CIC, CRM

	509,803 SF – Geosynthetic Clay Liner
	718,000 SF – Double-Sided Composite
	2,200 LF – 4” HDPE SDR 17 Gas System

NAME OF PROJECT:	**Dupont Chambers Works SWMU 52**
LOCATION:	Deepwater, NJ
NAME OF OWNER:	Dupont
ADDRESS OF OWNER:	Deepwater, NJ 08023
CONTRACTOR:	Entact, Inc.
CONTACT:	Shawn Todaro
POSITION:	Project Engineer
ADDRESS:	200 Centreport Drive Suite 350 Greensboro, NC 27409
TELEPHONE:	(336) 790 - 4902
BID AMOUNT:	$ 245,425.00
FINAL COST TO OWNER:	$ 245,425.00
COMMENCMENT DATE:	October 2006
COMPLETION DATE:	November 2006
SCOPE OF WORK:	Subcontractor – Supply & Install Geosynthetic Cap
QUANTITIES:	129,586 SF – 40 Mil Smooth LLDPE Liner
	129,586 SF – Geosynthetic Clay Liner
	129,586 SF – Double-Sided Composite

NAME OF PROJECT:	**US Steel – CAMU 1 and 2**
LOCATION:	Gary, IN
NAME OF OWNER:	US Steel
ADDRESS OF OWNER:	86 North Bridge Street Gary, IN 46404
CONTRACTOR:	Earth Tech
CONTACT:	Ed Ould
POSITION:	Project Manager
ADDRESS:	86 North Bridge Street Gary, IN 46404
TELEPHONE:	(804) 515 - 8300
BID AMOUNT:	$ 3,462,000.00
FINAL COST TO OWNER:	$ 4,345,557.00
COMMENCMENT DATE:	April 2002

NAME OF PROJECT:	**US Steel – CAMU 1 and 2 (continued)**
COMPLETION DATE:	January 2003
SCOPE OF WORK:	Subcontractor – Supply & Install Geosynthetic Materials for Cells
QUANTITIES:	1,250,000 SF – 60 Mil Textured HDPE Liner on 2:1 Slope
	2,235,000 SF - 60 Mil Smooth Liner
	1,735,000 SF – Geosynthetic Clay Liner
	2,392,000 SF – Composite
	1,352,000 SF – Geotextile

NAME OF PROJECT:	**Lakeland Disposal Final Closure**
LOCATION:	Warsaw, IN
NAME OF OWNER:	Lakeland Disposal Facility
ADDRESS OF OWNER:	5854 South 450 West Claypool, IN 46510
CONTRACTOR:	Entact
CONTACT:	Caroline Panico
POSITION:	Project Manager
ADDRESS:	1360 N. Wood Dale Road Suite A Wood Dale, IL 60191
TELEPHONE:	(630) 616 - 2100
BID AMOUNT:	$ 593,307.00
FINAL COST TO OWNER:	$ 610,878.00
COMMENCMENT DATE:	March 2002
COMPLETION DATE:	September 2002
SCOPE OF WORK:	Subcontractor – Supply & Install Geosynthetic Cap
QUANTITIES:	980,000 SF – 40 Mil Textured LLDPE Liner
	990,000 SF – Drainage Geocomposite

NAME OF PROJECT:	**Dupont Dry Run Closure**
LOCATION:	Lubeck, WV
NAME OF OWNER:	Dupont
ADDRESS OF OWNER:	795 Dry Run Lane Lubeck, WV 26101
CONTRACTOR:	Entact, Inc.

GCL Material Specifications and Installation Instructions

This page intentionally left blank.

Agru GeoClay NN66

Geotextile Component

Geotextile Property	Test Method	Frequency	Minimum Average Roll Value
Upper Nonwoven, Mass/Unit Area, oz/yd²(g/m²)	ASTM D5261	200,000 sf	6.0 (200)
Lower Nonwoven, Mass/Unit Area, oz/yd²(g/m²)	ASTM D5261	200,000 sf	6.0 (200)

Bentonite Property[1]	Test Method	Test Method	Minimum Average Roll Value
Swell Index, ml/2 g min	ASTM D5890	100,000 lb	24
Moisture Content, %	ASTM D4643	100,000 lb	12% max
Fluid Loss, ml	ASTM D5891	100,000 lb	18 max

Finished GCL Property	Test Method	Test Method	Minimum Average Roll Value
Bentonite, Mass/Unit Area[2], lb/ft² (kg/m²)	ASTM D5993	40,000 sf	0.75 (3.6)
Tensile Strength[3], lb/in (N/cm)	ASTM D6768	40,000 sf	50 (87)
Peel Strength[3] lb/in (N/cm)	ASTM D6496	40,000 sf	3.5 (6.1)
Hydraulic Conductivity[4] cm/sec max	ASTM D5887	1/week	5×10^{-9}
Index Flux[4] m³/m²/sec max	ASTM D5887	1/week	1×10^{-8}
Internal Shear Strength[5] psf (kPa)	ASTM D6243	Periodically	500 (24) Typical

Supply Information

Roll Size	Width		Length		Area	
	ft	m	ft	m	ft²	m²
	15.5	4.7	150	45.7	2,325	216

Notes:
(1) Bentonite properties tests performed at a bentonite processing facility prior to shipment to GCL production facility.
(2) Reported at 0% moisture
(3) Tensile strength testing performed in MD using ASTM D 6768.
(4) Deaired, deionized water @5 psi maximum effective confining stress and 2 psi head pressure.
(5) Specimens are hydrated for 24 hours and sheared at 200 psf. Represent typical peak value.
Rolls weigh approximately 2,600 lbs, are supplied with two straps and wound on a 4 75" core

AGRU AMERICA, INC. - QA/QC

Manufacturing – Quality Assurance/Quality Control

AGRU AMERICA, Inc. extrudes high density polyethylene (HDPE) and linear low density polyethylene (LLDPE) geomembrane, Geosynthetic Clay Liners (GCL), HDPE Geonet, PP Geotextile and Geocomposite products at its three production plants located at 500 Garrison Road, Georgetown, South Carolina, 29440, 181 Hwy 521, Andrews, South Carolina, and 2000 East Newlands Drive, Fernley, Nevada, 89408.

Our USA Manufacturing Quality Assurance Program is dependent on the utilization of in-house laboratories in each plant which are, when necessary, complemented with testing performed by certified outside laboratories such as:

- Precision Geosynthetic Laboratories; Anaheim, CA
  Telephone (714) 520-9631; Fax (714) 520-9637
- TRI/Environmental, Inc.; Austin, Texas
  Telephone (512) 263-2101; Fax (512) 263-2558

  And other GRI-LAP accredited laboratories.

Raw Material – Manufacturer's Certificate of Conformity

Geotextiles and bentonite are used in the manufacture of geosynthetic clay liners:

- Prior to shipment, our bentonite supplier submits a certificate of analysis. Once approved, the bentonite is released for shipment to our plant.
- At least weekly one sample is taken from a rail car after arrival and tested as follows:
  Swell Index ASTM D5890, Fluid Loss ASTM D5891, Moisture Content ASTM D2216 and particle size ASTM C136.
- The woven geotextile component is manufactured by others and must meet all Agru minimum requirements before it is introduced into the manufacturing process.
- The nonwoven geotextile is made by Agru or by others. In either case, it is tested to assure it meets our minimum properties before it is introduced into the manufacturing process.
- Off specification bentonite and/or geotextile is returned to the supplier.
- The Manufacturer's moisture content test data is reported on the GCL Quality Certificate.

1

Geosynthetic Clay Liner (GCL)

The Manufacturing Process

The bentonite is conveyed through a vacuum pump system and flexible hoses to a hopper, gravity feeding the bentonite onto the surface of the lower geotextile. The upper geotextile is then introduced on top of the layer of bentonite. This three layer product (lower textile, bentonite and upper geotextile) then go through a needle board which locks in the bentonite by needle punching textiles from the top layer to the bottom layer and vice versa.

Exiting the needle board, the rolls of finished GCL go through a magnet and needle detection system to ensure that the finished product is needle free. If needles are detected, the roll is tagged for additional inspection.

In addition to a metal detector and alarm, the GCL is also visually inspected to ensure there are no other surface defects as the material travels through the manufacturing process.

A line on either edge of the GCL are placed 6 inches in from the edge. These lines represent the minimum amount of overlap that should be used during installation.

The GCL is wound on a recycled HDPE core having 6" ID (150mm), 7" OD (175mm) and length corresponding to roll width.

Each standard length roll weighs approximately 2,500 – 4,000 pounds (1130-1815 kg). Rolls are placed in UV resistant plastic bags and sealed on the open end to prevent hydration or loss of bentonite.

Post Manufacturing Quality Control

Once start-up conditions are over and commercial manufacturing is initiated, post-production quality control comes into operation. A series of test procedures are performed based upon either our standard frequency of testing (attached), or frequencies required by customer specifications.

A sample approximately 2' by the full width of the GCL is taken from every 40,000 SF (14 rolls). Based on the specified test frequencies, certain specimens are die cut, tested, and the results summarized on the Quality Certificate issued by our Quality Control Department. The certificate is signed electronically by the Quality Control Manager. The Quality Control Manager reports directly to the President of the Company.

Rolls failing to comply with either Customer Project Specifications and/or our own latest revision to our published data sheets are set aside and re-classified as off-spec (Class B rolls).

Quality Certificates are provided for all rolls of GCLs, with the exception of off-spec (Class B rolls).

Sometimes a third party Quality Assurance representative is mandated by the owner of a project to oversee our manufacturing QA. We gladly subscribe to this procedure and make all our records available 24 hours a day for the duration of the mandate.

The following roll identification items are reported in our Quality Certificate:

Roll number

(example) **G13E383069**

G	1 3	E	3 8	3	0	6	9
PLANT ID	YEAR	MACHINE ID	WEEK	DAY OF WEEK (MONDAY = 1)	COUNTER FOR WEEK		

First digit	Plant (G=Georgetown / F=Fernley)
Second and Third digits	Year (13 = 2013)
Fourth digit	Machine ID
Fifth & Sixth digits	Week in the current year
Seventh digit	day of week (Monday=1, Sunday=7)
Last three digits	counter for the week (starts at 001)

Using the above key:

Roll #G13E383069 was produced in Georgetown, on Liner Machine E on Wednesday in the 38th week in 2013 (9/18/13).

Product Description GCL type: Agru GeoClay

Roll Length & Width in feet / meters

Raw material lot and/or batch number and supplier/product identification (from Resin Manufacturer's Certificate of Analysis – sample attached)

All GCL rolls are labeled as follows:

- roll stickers on the cores for each roll
- roll stickers on the outside of the finished roll
- written (paint pen) roll numbers on each face (flat ends)
- written (paint pen) roll numbers on the outside of the finished roll.

The following test results are reported in the GCL Quality Certificate, derived from our Standard Test Frequency (attached) and/or supplied raw material manufacturer Certificates of Analysis (Tests performed are the latest revisions of the Standards listed):

Test / Method	Results Reported & Modifications to Standard (if any)
Swell Index ASTM D5890	MARV is reported in ml/2 g min **Modification from Standard =**
Fluid Loss ASTM D5891 Textured liner only	%
Bentonite Mass per Unit Area ASTM D5993	lb/ft^2 Mass is reported at zero % moisture in units of lb/ft^2.
Tensile Strength ASTM D6768	lb/in Reported for machine direction only.
Peel strength ASTM D6496	lb/in Reported for machine direction only
Hydraulic conductivity ASTM D5887	cm/sec max. Tested using deaired, deionized water @ 5psi maximum confining stress and 2 psi head pressure.
Index Flux ASTM D5887	m^3/m^2/sec max Tested using deaired, deionized water @ 5psi maximum confining stress and 2 psi head pressure
Internal Shear Strength ASTM D6243	Psf Specimens are hydrated for 24 hours and sheared at 200 psf. Represents typical peak value.

The following Test Methods / Results are not certified by Agru America, as they are not required by the GRI GC3, and are not considered typical MQC tests.

Test / Method	Results Certified
Nominal Thickness ASTM D5199	mils
Index Puncture Resistance ASTM D4833	lbf

AGRU GEOCLAY™ GEOSYNTHETIC CLAY LINER INSTALLATION MANUAL

Agru America, Inc. is not an installer of Geosynthetic Clay Liners. This manual is provided only as a guideline and not meant as an authority of exactitude. Agru America will not be held liable for the installation of others.

PART 1 - GENERAL

1.01 Summary

This manual provides guidance and a general overview of the procedures for the installation of Agru GeoClay™ geosynthetic clay liners (GCLs). These procedures are consistent with standard industry accepted practices and are designed to ensure that the GCL is handled and installed in a manner that maximizes safety, efficiency, and the physical integrity of the GCL.

These guidelines are based upon experience at a variety of different sites and should be generally applicable to any type of lining project using Agru GeoClay™. Any variance from or additional requirements to these guidelines would be at the engineer's discretion. Therefore, it should be noted that strict adherence to the customer's project specific specification is also required.

The ultimate performance of Agru GeoClay™ or any GCL is fully dependent on the quality of its installation. Therefore, it is the installer's responsibility to adhere to these guidelines, as well as the project specifications and drawings, as closely as possible. In addition, it is the responsibility of the engineer and owner to provide construction quality assurance (CQA) for the installation in order to ensure the proper installation. This document covers only installation procedures.

For additional guidance or assistance regarding Agru GeoClay™, you may contact Agru America, Inc.'s Technical Support Staff at (843) 546-0600.

For additional guidance beyond this document, refer to the standards referenced below.

PART 2 – Equipment and Personnel Requirements

2.01 Installer Requirements

Agru America, Inc. (Agru) is committed to ensuring that its Agru GeoClay™ is installed properly to fully ensure the physical integrity and performance of the material. Therefore, Agru reserves the right to limit the sale of any of its materials to customers who can show that they have adequate equipment, personnel, experience and knowledge to provide the proper installation required.

2.02 Personnel Requirements

It is the sole responsibility of the Installer to ensure that an adequate number of appropriately trained personnel are provided to ensure the proper and safe installation of Agru GeoClay™.

2.03 Equipment Requirements

Agru GeoClay™ is delivered in rolls which are typically 1,600-3,500 lbs (725-1600kg). Product dimensions and weights will vary according to the specific AGRU GeoClay™ product which is ordered. Please note that it is necessary to support this weight using an appropriate core pipe or other method for lifting the GeoClay rolls. For any installation, it is important to minimize the deflection of a roll to a maximum of 3" (75mm) from midpoint to either end when a full GCL roll is lifted.

Appropriately rated lifting chains/straps may be used in combination with a steel pipe (preferably solid) and an I-beam to fabricate a "spreader bar". The spreader bar ensures lifting chains or straps do not chafe against the ends of the roll, allowing it to rotate freely during installation. The entire assembly with the roll can then be lifted with a crane, front end loader, excavator or other suitable equipment for deployment.

Alternatively, a forklift specially fitted with a carpet pole (stinger) attachment may also be used for on-site handling. A forklift without a stinger attachment should not be used to lift or handle the rolls.

When installing over certain geosynthetic materials, a 4-wheel, all-terrain vehicle (ATV) can be used to deploy the GeoClay™. An ATV can be driven directly on the GCL provided that no sudden stops, starts, or tums are made and the ground pressure exerted ATV is kept to a minimum.

Additional equipment that may be needed for installation includes, but may not be limited to, the following:

- Utility knife and spare blades.
- Granular bentonite (available from Agru) for enhanced seams and for sealing around structures.
- Waterproof tarpaulins (for temporary cover on installed material as well as for stockpiled rolls).
- Flat-bladed vise grip pliers (for adjusting/positioning panels by hand).

PART 3 – Shipping, Unloading and Storage

3.01 Shipping

All material lot and roll numbers should be recorded and compared to the packing list. In addition, each roll of GeoClay™ should also be visually inspected to determine if any of the materials have been damaged.

Major damage suspected to have occurred during loading/unloading or transit should be reported immediately to the carrier and to Agru America, Inc. The exact nature and extent of the damage should also be indicated on the bill of lading along with the specific lot and roll numbers of the damaged materials.

Accumulation of some moisture within roll packaging is normal and does not damage the product.

3.02 Loading/Unloading

The party directly responsible for unloading the GeoClay™ should refer to this manual prior to arrival of the material in order to ascertain the appropriateness of their unloading equipment and procedures. All unloading and on-site handling efforts should be appropriately supervised.

In most cases, Agru GeoClay™ is delivered on flatbed trucks. There are three methods of unloading: core pipe and spreader bar; slings; or stinger bar. To unload the rolls from the flat-bed using a core pipe and spreader bar, first insert the core pipe through the core tube. Secure the lifting chains or straps to each end of the core pipe and to the spreader bar mounted on the lifting equipment. Hoist the roll straight up and make sure its weight is evenly distributed so that it does not tilt or sway when lifted.

Agru GeoClay™ is typically delivered with two polyester endless slings on each roll. Wherever possible the core pipe should be inserted in the core tube for support even when lifting with the slings. Before lifting, it is very important to check the position of the slings. Each sling should be attached in the choke position approximately one third from the end of the roll. Always lift the roll straight up so that it does not tilt or sway when lifted.

In some cases, GeoClay™ rolls will be stacked in pyramids on flatbed trucks. If slings are not used, the rolls must be unloaded using a stinger/carpet pole on an extendible boom fork lift. The use of a spreader bars will not work in this situation due to the limited access between the pyramids of GeoClay™. To unload, guide the stinger through the core tube before lifting the GCL roll and carefully remove the roll from the truck.

An extendible boom fork lift equipped with a stinger is required for unloading enclosed containers. Rolls in the front and center of the container should first be carefully pulled toward the door using the slings provided prior to removing.

3.03 Storage

AGRU GeoClay™ rolls should be stored at the job site away from high-traffic areas which may result in damage to the material. However, they should be as close as possible to the deployment area to minimize handling. Any designated storage area should be flat, dry and stable. Regardless, the storage area SHOULD not be located in an area that is susceptible to flooding or in areas known for high storm water runoff.

All Rolls should be carefully stacked in a manner that prevents them from sliding or rolling. This typically requires chocking the bottom layer of rolls. Agru GeoClay™ rolls should be stacked only as high as can be safely handled by the Installers personnel and equipment under the site specific conditions (typically no higher than four rolls high). Agru GeoClay rolls should never be stacked on end.

While the Agru GeoClay's packaging is designed to provide some moisture protection, additional tarpaulins or plastic sheeting is/are also recommended to cover and protect the rolls of GCL material. Any rolls of material that are identified as being potentially hydrated or physically damaged should be isolated for further inspection to determine the extent of their usability.

PART 4 – Subgrade Preparation

4.01 Subgrade Inspection

When Agru GeoClay™ isdeployed over a soil subgrade, the finished surface should be smooth without any abrupt elevation changes, voids, cracks, ice, or standing water. In addition it should be firm and unyielding, and compacted to a degree such that deployment or other construction equipment does not leave tracks or ruts greater than 1" (25 mm) in depth.

The prepared subgrade surface must be smooth and free of any vegetation, sharp-edged rocks, stones, sticks, construction debris, and other foreign matter that could contact and potentially damage the GCL. The subgrade should be rolled with a smooth-drum compactor to remove any wheel ruts, tracks, or other abrupt grade changes greater than 1" (25mm) in depth. Furthermore, all protrusions extending more than 0.5 inch (12 mm) from the subgrade surface shall be removed. The GCL may be installed on a frozen subgrade, however only if the subgrade soil in the unfrozen state meets the requirements listed above.

In applications where the Agru GeoClay™ is the only barrier, subgrade surfaces consisting of granular soils or gravels are not acceptable due to their large void fraction and puncture potential. In these applications subgrade soils should have a particle-size distribution at least 80% passing a #60 sieve with no particles greater than ¾" (19 mm).

4.02 Subgrade Approval

Notwithstanding the above requirements, the subgrade surface must also be prepared in strict accordance with the project drawings and specifications, and the engineer's approval of the subgrade must be obtained prior to material deployment.

PART 5 - Installation

5.01 Material Deployment

Agru GeoClay™ rolls should be transported to the deployment area in their original packaging. The orientation of the GCL (i.e., which side faces up) may be important if the GCL has differing types of geotextiles/geosynthetics. Always check with the project engineer in order to determine if there is a preferred installation orientation for the GCL.

If no specific orientation is specified or required, allow the roll to unwind from the bottom rather than pulling the flap from the top. Take care in removing the packaging so as not to damage the rolls.

Agru GeoClay™ rolls should not be released on the slope and allowed to unroll freely by gravity.

Agru GeoClay™ should always be cut using a sharp utility knife. Frequent blade replacement is recommended to avoid irregular tearing of the geotextile components during the cutting process.

Equipment which could damage the GCL should not be allowed to travel directly on it. Allowable equipment which may be utilized on the GCL is limited to lightweight ATVs with a maximum bearing capacity of 5psi (21.5 kPa). Care should always be taken in the operation of any equipment on Agru GeoClay™ so as to avoid sudden starts and stops, abrupt turns, or other maneuvers that could damage the GCL.

To minimize traffic on the Agru GeoClay™, installation may be accomplished by unrolling the GCL in front of a vehicle moving backwards. Any rutting or other damage to the subgrade must be repaired prior to the continued placement of the GCL or other material. Alternately if sufficient access is available, Agru GeoClay™ may be deployed by suspending the roll from a spreader bar at the top of the slope and using a group of laborers and equipment to spool the material off of the roll and pull it down the slope.

Regardless of the deployment method care must be taken to minimize the extent to which the roll is dragged across the subgrade or other surface in order to prevent damage to the GCL. Care must also be taken when adjusting the GCL panels to avoid damage to the geotextile surface by the subgrade or another adjacent geosynthetic material such as a textured geomembrane. A temporary geosynthetic/geomembrane sheet, commonly known as a slip sheet or rub sheet, may be used to prevent or reduce friction damage during placement.

The GCL should always be deployed/placed so that longitudinal seams are parallel to the direction of the slope. End-of-panel or butt seams should also be located a minimum of 3' (1 m) from the toe and crest of any slopes steeper than 4H:1V. Butt seams on slopes should be used only if the liner is not expected to be in tension and interface friction testing confirms this.

All Agru GeoClay™ panels should be placed to lie flat, with no wrinkles or folds, especially at the exposed edges of the panels.

Several General rules for the deployment of Agru GeoClay™ in order to prevent premature hydration are as follow:

- Never install in standing water or during rainy weather.
- Only deploy as much Agru GeoClay™ as can be covered at the end of the working day with soil, geomembrane, or a temporary waterproof tarpaulin, and
- Agru GeoClay™ should not be left uncovered ovemight.

If Agru GeoClay™ is allowed to hydrate when no confining stress is present, it may be necessary to remove and replace the hydrated material. Agru recommends that premature hydration be evaluated on a case-by-case basis. The project engineer or CQA inspector should be consulted for specific guidance if premature hydration occurs. The type of GCL, duration of exposure, degree of hydration, location in the liner system, and expected bearing loads should be considered. In many instances, a needlepunched reinforced GCL may not require removal/replacement if the following are true:

(1) the geotextiles have not been separated, tom or otherwise damaged;
(2) there is no evidence that the needlepunching between the two geotextiles has been compromised;
(3) the GCL does not leave deep indentations when stepped upon; and
(4) any overlapped seams with bentonite enhancement (see Section 7) are intact.

5.02 Anchorage

The end(s) of the roll may require placement in an anchor trench at the top of a berm or slope. The front edge of this anchor trench should be rounded to eliminate any sharp corners or protrusions which may cause excessive stress on the GCL. Loose soil should be removed or compacted into the floor of the trench prior to placement of the GCL.

The GCL should be placed in the anchor trench such that it covers the entire trench floor but does not extend up the rear trench wall.

To complete the anchor trench, soil backfill should be placed in the trench to provide resistance against pullout. The size and shape of the trench, as well as the appropriate backfill procedures, should be in accordance with the project drawings and specifications.

Sufficient anchorage may alternately be obtained by extending the end(s) of the Agru GeoClay™ rolls beyond the crest of the slope a prescribed distance and covering with soil. The length of this "run out" anchor, as well as the amount of cover soil, should be in accordance with any project drawings and specifications.

5.03 Seaming

Agru GeoClay™ seams are constructed by overlapping adjacent panel edges and ends. Care should be taken to ensure that the overlap zone is not contaminated with loose soil or other debris. For pond applications, supplemental bentonite must be used in longitudinal seams regardless of the specific Agru GeoClay™ GCL used.

Longitudinal seams should be overlapped a minimum of 6" (150mm). For high-head applications (greater than 1' or 30.48 cm), a minimum longitudinal seam overlap of 12" (300 mm) and supplemental bentonite is recommended. Butt seams should be overlapped 24 inches (600mm).

Butt seams are constructed such that they are shingled in the direction of the grade to prevent runoff from entering the overlap zone. Butt seams on slopes are permissible, provided adequate slope stability analysis has been conducted (i.e., the GCL is not expected to be in tension). Bentonite-enhancement is required for all butt seams.

Bentonite-enhanced butt seams are constructed first by overlapping the adjacent panels, exposing the underlying panel, and then applying a continuous bead or fillet of granular sodium bentonite 12" (300mm) from the edge of the underlying panel. The minimum application rate at which the bentonite is applied is one-quarter pound per linear foot (0.4 kg/m).

If bentonite enhancement is required for longitudinal seams are required, they are constructed by first overlapping the adjacent panels by a minimum 6" (150 mm), exposing the underlying edge, and applying a continuous bead of granular bentonite approximately 3" (75 mm) from the edge. For pond

applications, longitudinal seams are constructed by overlapping adjacent panels by 12" (300 mm), exposing the underlying edge and applying a continuous bead of bentonite approximately 6" (150 mm) from the edge. The minimum application rate for the granular bentonite is one quarter pound per linear foot (0.4 kg/m).

5.04 Sealing around Penetrations and Structures

The Installation of Agru GeoClay™ around structures or penetrations should be in accordance with the project drawings and specifications. Agru GeoClay may be secured to structures through the use of mechanical fasteners, clamps, batten bars, or other methods. The Agru GeoClay™ should be sealed around any penetrations, structures embedded in the subgrade, and/or other appurtenances by liberally using granular bentonite (approx. 2 lb/ln ft. or 3 kg/m) to seal the GCL to these structures.

When Agru GeoClay™ is placed over a penetration (pipe, piling, or other appurtenance), a "notch" should be excavated into the subgrade around the penetration to a depth of approximately 4" (100mm) and at a width of approximately 3" (75mm) around the entire structure. The notch should then be filled with granular bentonite. A secondary GCL collar fabricated from Agru GeoClay™ should then be placed around the penetration. It is usually helpful to first trace the outline of the penetration on the GCL and then cut a star-shaped pattern in the collar to enhance the collar's fit to the penetration. The GCL collar should extend a minimum of 12" (300mm) from the structure in all directions. Granular bentonite should be placed between the primary GCL and the secondary GCL collar as well as in in minor gaps or voids that may exist around the interface with the structure.

When Agru GeoClay™ is terminated at a structure that is embedded into the subgrade on the containment area floor, the subgrade should be notched as described previously. The notch is filled with granular bentonite, and the GCL should be placed over the notch and up against the structure. Connection to the structure can be accomplished through the placement of soil or stone backfill in this area. Should the structure be located at the top of a slope, additional detailing may be required.

5.05 Damage Repair

If the Agru GeoClay™ is damaged (tom, punctured, perforated, etc.) during installation, it may be possible to repair it by cutting a patch of Agru GeoClay™ to cover the damaged area. Any damaged material should be brought to the attention of the Engineer in order to determine the extent of the

damage and any repairs which may be required.

If it is determined that the damaged roll is reparable, a patch of Agru GeoClay™ can be cut to cover the damaged area. The patch should be sized such that a minimum overlap of 12 inches (300 mm) is achieved around all parts of the damaged area. Granular bentonite should be liberally applied around the damaged area prior to placement of the patch.

Depending on site conditions, it may be necessary to use an adhesive such as wood glue to affix the patch in place to prevent displacement during cover placement. Smaller patches may be tucked under the damaged area to prevent patch movement.

PART 6 – Cover Placement

6.01 General Cover Information

Only as much GCL shall be deployed as can be covered by the end of the working day with soil, geomembrane, or a temporary waterproof tarpaulin. The GCL shall not be left uncovered overnight. As previously noted, if the GCL is hydrated in the absence of confining stress, it may be necessary to remove and replace the hydrated material.

6.02 Soil Cover Requirements

The required thickness of soil cover over Agru GeoClay™ varies with the application. However, a minimum of 1' (300 mm) of cover is typically required to provide the appropriate confining stress to the GCL, thereby eliminating the potential for seam separation and preventing potential damage of exposed or inadequately covered material.

Any soils (including cover soils) used in direct contact with the GCL should be free of angular stones or other foreign matter that could damage the material. In addition, any cover soils should be approved by the Engineer with respect to particle size, uniformity, and chemical compatibility. Consult with the Engineer and Agru if cover soils containing high concentrations of calcium (e.g., limestone, dolomite, gypsum, seashell fragments) are present.

Cover soils with a particle size distribution ranging between fines and 1 inch (25 mm) are recommended for direct placement on the GCL, unless a cushioning geotextile is utilized.

6.03 Cover Placement

Soil cover shall be placed over the GCL only using construction equipment that minimizes stresses on the GCL. A minimum thickness of 1' (300 mm) of cover material should be maintained between any equipment tires/tracks and the Agru GeoClay at all times. In areas of high-traffic or roadways, a minimum thickness of 2 feet (600 mm) is required.

Soil cover should be placed in a manner that prevents the soil from entering the GCL seams. Soil cover should always be pushed up slopes, not down slopes, to minimize tensile forces on the GCL.

When a geomembrane liner is being placed over the GCL, the leading edge of the GCL should be folded and tucked under the geomembrane so that the leading edge of the geomembrane extends a minimum of 2' (600mm) beyond the GCL. Sand bags or other suitable ballast should

be used to secure the edge of the geomembrane against wind uplift or storm water runoff.

When a textured geomembrane is installed over the GCL, a temporary geosynthetic covering commonly referred to as a slip sheet or rub sheet should be used to minimize friction during placement and to allow the textured geomembrane to be more easily moved into its final position.

Cyclical wetting and drying of Agru GeoClay™ covered only with geomembrane may cause overlap separation. Therefore, soil cover should be placed promptly whenever possible. Geomembranes should be covered with a white geotextile and/or operations layer without delay to minimize the intensity of wet-dry cycling. If there is the potential for unconfined cyclic wetting and drying over an extended period of time, the longitudinal seam overlaps should be increased based on the project engineer's recommendations.

To avoid potential seam separation, the GCL should not be placed in tension by the weight or movement of a textured geomembrane on steep slopes. In the event that there is the potential for expansion and contraction of an unconfined geomembrane over an extended period of time, the longitudinal seam overlaps should be increased based upon the project engineer's recommendations.

PART 7 - Hydration

7.01 Hydration Methods

Ultimately, hydration of the Agru GeoClay™ will be required in order for the material to perform properly as a barrier layer. It is very important to note that this hydration must occur in the presence of a confining stress. The confining stress is most often provided through the use of a minimum of 12" (300mm) of cover soil.

Hydration is typically accomplished naturally by rainfall and/or the absorption of moisture from soil. However, in cases where the containment of non-aqueous liquid is required, it may be necessary to manually hydrate the covered GCL prior to use. If such manual hydration is necessary, water may be introduced to the GCL by flooding the covered lined area or by using a sprinkler system, irrigation system or other method of applying the water for hydration.

7.02 Premature Hydration

In the event that the Agru GeoClay™ is hydrated in the absence of confining stress, it may be necessary to remove and replace the improperly hydrated material. However, as discussed earlier in Part 5, a reinforced GCL may not require removal/replacement if the following are true:

- The GCL's component geotextiles have not been torn, separated, or otherwise compromised/damaged;
- There is no physical evidence that the needle punching between the two geotextiles has been compromised;
- The GCL does not exhibit deep indentations from being walked upon or from other pressures that may have been applied, and
- The overlapped seams with bentonite enhancement remain intact.

APPENDIX O5

GCL Manufacturer's Certifications and Test Data

This page intentionally left blank.

GCL Quality Certification

Customer:	Environmental Specialist
PO#:	22077 Savannah River Nuclear Site
Destination:	Aiken SC
doc #:	30000

GCL Type
NN66-7S

Quality Control Manager

Agru America hereby affirms that all GeoClay geosynthetic clay liner material manufactured for this project was continually passed under a magnet for needle removal.

Gcl bentonite mass per unit area value is measured at 0% moisture

Bentonite property tests are performed at a bentonite processing facility before shipment to Agru's production facility.

All tensile testing is in the machine direction using ASTM D 6768. All peel strength testing is performed using ASTM D 6496. Upon request tensile and peel results can be reported per modified ASTM D 4632 using 4 inch grips.

doc #:	30000

GCL Type
NN66-7S

Quality Control Manager

Agru America hereby affirms that all GeoClay geosynthetic clay liner material manufactured for this project was continually passed under a magnet for needle removal.

Gcl bentonite mass per unit area value is measured at 0% moisture

Bentonite property tests are performed at a bentonite processing facility before shipment to Agru's production facility.

All tensile testing is in the machine direction using ASTM D 6768. All peel strength testing is performed using ASTM D 6496. Upon request tensile and peel results can be reported per modified ASTM D 4632 using 4 inch grips.

Destination: Aiken SC
doc #: 30000

GCL Type: NN66-7S

Quality Control Manager

Agru America hereby affirms that all GeoClay geosynthetic clay liner material manufactured for this project was continually passed under a magnet for needle removal.

Gcl bentonite mass per unit area value is measured at 0% moisture

Bentonite property tests are performed at a bentonite processing facility before shipment to Agru's production facility.

All tensile testing is in the machine direction using ASTM D 6768. All peel strength testing is performed using ASTM D 6496. Upon request tensile and peel results can be reported per modified ASTM D 4632 using 4 inch grips.

AGRU AMERICA, INC. - 2015 ANNUAL SHEARING TEST PROGRAM
GCL DIRECT SHEAR TESTING (ASTM D 6243)

Upper Shear Box: Steel grip
Hydrated Agru Geoclay NN66-7S GCL #G15G04048
Lower Shear Box: Steel grip

Test No.	Shear Box Size (in. x in.)	Normal Stress (psf)	Shear Rate (in./min)	Soaking		Consolidation (Stress and Time)						GCL		Measured Strength(1)		GCL Strength	
				Stress (psf)	Time (hours)	Phase 1 (psf)	Phase 1 (hour)	Phase 2 (psf)	Phase 2 (hour)	Phase 3 (psf)	Phase 3 (hour)	ω_i (%)	ω_f (%)	τ_P (psf)	τ_{LD} (psf)	τ_P (psf)	τ_{LD} (psf)
1A	12 x 12	200	0.04	200	24								107	1104	195	> 1104	NR(2)

NOTES:
(1) Shear failure (sliding) occurred between the steel grip and geotextile of GCL. Therefore, the actual peak strength of the received GCL sample≥ the measured peak shear strength.
(2) Not reported.

APPENDIX O6

GCL Conformance Test Reports

This page intentionally left blank.

GCL Quality Certification

Customer:	Environmental Specialist
PO#:	22077 Savannah River Nuclear Site
Destination:	Aiken SC
doc #:	30000

GCL Type
NN66-7S

Quality Control Manager

Agru America hereby affirms that all GeoClay geosynthetic clay liner material manufactured for this project was continually passed under a magnet for needle removal.

Gcl bentonite mass per unit area value is measured at 0% moisture

Bentonite property tests are performed at a bentonite processing facility before shipment to Agru's production facility.

All tensile testing is in the machine direction using ASTM D 6768. All peel strength testing is performed using ASTM D 6496. Upon request tensile and peel results can be reported per modified ASTM D 4632 using 4 inch grips.

Destination: Aiken SC
doc #: 30000

GCL Type: NN66-7S

Quality Control Manager

Agru America hereby affirms that all GeoClay geosynthetic clay liner material manufactured for this project was continually passed under a magnet for needle removal.

Gcl bentonite mass per unit area value is measured at 0% moisture

Bentonite property tests are performed at a bentonite processing facility before shipment to Agru's production facility.

All tensile testing is in the machine direction using ASTM D 6768. All peel strength testing is performed using ASTM D 6496. Upon request tensile and peel results can be reported per modified ASTM D 4632 using 4 inch grips.

Destination: Aiken SC
doc #: 30000

GCL Type: NN66-7S

Quality Control Manager

Agru America hereby affirms that all GeoClay geosynthetic clay liner material manufactured for this project was continually passed under a magnet for needle removal.

Gcl bentonite mass per unit area value is measured at 0% moisture

Bentonite property tests are performed at a bentonite processing facility before shipment to Agru's production facility.

All tensile testing is in the machine direction using ASTM D 6768. All peel strength testing is performed using ASTM D 6496. Upon request tensile and peel results can be reported per modified ASTM D 4632 using 4 inch grips.

Dear Mr. Vidrine:

Thank you for consulting TRI/Environmental, Inc. (TRI) for your geosynthetics testing needs.
TRI is pleased to submit this final report for laboratory testing.

Project:	**Savannah River Nuclear**
TRI Job Reference Number:	E2401-84-03
Material(s) Tested:	One GeoClay NN66-7S GCL(s)
Test(s) Requested:	Mass/Unit Area (ASTM D5993) Bentonite - Fluid Loss (ASTM D5891) Bentonite - Swell Index (ASTM D5890)

If you have any questions or require any additional information, please call us at 1-800-880-8378.

Sincerely,

John M. Allen, P.E.
Division Director
Geosynthetic Services Division
www.GeosyntheticTesting.com

The testing herein is based upon accepted industry practice as well as the test method listed. Test results reported herein do not apply to samples other than those tested. TRI neither accepts responsibility for nor makes claim as to the final use and purpose of the material. TRI observes and maintains client confidentiality. TRI limits reproduction of this report, except in full, without prior approval of TRI.

Dear Mr. Vidrine:

Thank you for consulting TRI/Environmental, Inc. (TRI) for your geosynthetics testing needs. TRI is pleased to submit this final report for the requested laboratory testing.

Project:	**Savannah River Nuclear**
TRI Job Reference Number:	E2392-84-05
Materials Tested:	Seven GeoClay NN66-7S GCL Roll-width Samples
Tests Requested:	Mass/Unit Area (ASTM D5993) Bentonite - Fluid Loss (ASTM D5891) Bentonite - Swell Index (ASTM D5890)

If you have any questions or require any additional information, please call us at 1-800-880-8378.

Sincerely,

Richard S. Lacey, P.E.
Senior Engineer
Geosynthetic Services Division

Dear Mr. Vidrine:

Thank you for consulting TRI/Environmental, Inc. (TRI) for your geosynthetics testing needs.
TRI is pleased to submit this final report for laboratory testing.

Project:	**Savannah River Nuclear**
TRI Job Reference Number:	E2401-84-08
Material(s) Tested:	Three GeoClay NN66-7S GCL(s)
Test(s) Requested:	Mass/Unit Area (ASTM D5993) Bentonite - Fluid Loss (ASTM D5891) Bentonite - Swell Index (ASTM D5890)

If you have any questions or require any additional information, please call us at 1-800-880-8378.

Sincerely,

John M. Allen, P.E.
Division Director
Geosynthetic Services Division

Dear Mr. Vidrine:

Thank you for consulting TRI/Environmental, Inc. (TRI) for your geosynthetics testing needs.
TRI is pleased to submit this final report for the laboratory testing performed on the sample listed below.

Project:	**Savannah River Nuclear**
TRI Job Reference Number:	E2392-87-02
Material Tested:	One GeoClay NN66-7S GCL
Tests Requested:	Mass/Unit Area (ASTM D5993) Bentonite - Fluid Loss (ASTM D5891) Bentonite - Swell Index (ASTM D5890)

If you have any questions or require any additional information, please call us at 1-800-880-8378.

Sincerely,

Richard S. Lacey, P.E.
Senior Engineer
Geosynthetic Services Division

AGRU AMERICA, INC. - QA/QC

Manufacturing – Quality Assurance/Quality Control

AGRU AMERICA, Inc. extrudes high density polyethylene (HDPE) and linear low density polyethylene (LLDPE) geomembrane, HDPE Geonet, Geocomposite, geotextile and GCL products at its three production plants located at 500 Garrison Road, Georgetown, South Carolina, 29440, 2000 East Newlands Drive, Fernley, Nevada, 89408 and 181 Hwy 521, Andrews SC 29510.

Our USA Manufacturing Quality Assurance Program is dependent on the utilization of in-house laboratories in each plant which are, when necessary, complemented with testing performed by certified outside laboratories such as:

- TRI/Environmental California; Anaheim, CA
  Telephone (714) 520-9631; Fax (714) 520-9637
- TRI/Environmental, Inc.; Austin, Texas
  Telephone (512) 263-2101; Fax (512) 263-2558

  And other GRI-LAP accredited laboratories.

Raw Material – Manufacturer's Certificate of Conformity

HDPE and LLDPE resin is supplied to our plants in bulk and subjected to the following procedures:

- Prior to shipment, our resin supplier submits a certificate of analysis. Once approved, the resin is released for shipment to our plant.
- One sample is taken from each rail car after arrival and tested as follows:
  Melt Index ASTM D1238 190°C, 2.16kg, and Density ASTM D792 Method B.
- Once the tests have been completed and results found to be in compliance with our requirements, the resin is then unloaded into our silo system.
- At this stage, our supplier has performed one battery of tests and Agru America has performed one to verify the manufacturer's certificate of analysis.
- Off specification resin is returned to the supplier.
- The Manufacturer's MFI Test Data is reported on the Geomembrane Quality Certificate (Agru America's MFI Testing is done to verify the resin manufacturer's reported data).

GEOMEMBRANE

The Extrusion Process

The resin is conveyed through a vacuum pump system and flexible hoses to a dryer hopper, feeding the resin by gravity into an 8-inch barrel. This barrel is divided into five heating zones, each heating zone being computer controlled and constantly monitored.

A screw in the barrel turns at a prescribed and monitored speed. It conveys the resin slowly to full plastication, and then the plasticated resin is fed through a manifold into a coat hanger die having a width of approximately 24 feet. The die lips are open to a prescribed distance governed by the thickness of the geomembrane to be extruded.

Exiting the die, the plasticated resin forms a controlled and monitored bead, which feeds into a chrome three-roll stack in a prescribed pattern. Each chrome roll is set at a prescribed temperature, controlled by water circulation.

Exiting the controlled cooling of the roll stack, the geomembrane travels down the take off haulers towards the winder. On the way to the take off, the liner is trimmed to bring the finished width to the applicable standard. Trimmings are granulated.

The trimmed edge of one side of the geomembrane is marked every meter (3.28 ft) with thickness, resin type (HDPE or LLDPE), Agru America name, and year of manufacture. This marking also serves as product identification.

The geomembrane is visually inspected for surface defects as it travels down the take off by both the extruder and the winder operators.

The geomembrane is wound on a recycled HDPE core having 6” ID (150mm), 7” OD (175mm) and 22’8” (6.8m) length.

Each standard length roll weighs approximately 3,900 pounds (1770 kg.). Rolls are fitted with two nylon slings when shipped.

Post Extrusion Quality Control

Once start-up conditions are over and commercial extrusion is initiated, post-production quality control comes into operation. A series of test procedures are performed based upon either our standard frequency of testing (attached), or frequencies required by customer specifications.

A sample approximately 11” by the full width of the geomembrane is taken from every roll. Based on the specified test frequencies, certain specimens are die cut, tested, and the results summarized on the Quality Certificate issued by our Quality Control Department. The certificate is signed electronically by the Quality Control Manager. The Quality Control Manager reports directly to the President of the Company.

Rolls failing to comply with either customer project specifications and/or our own latest revision to our published data sheets are set aside and re-classified as off-spec (Class B rolls).

Quality Certificates are provided for all rolls of geomembrane (sample smooth & Microspike® certificates are attached) with the exception of off-spec (Class B rolls).

Sometimes a third party quality assurance representative is mandated by the owner of a project to oversee our manufacturing QA. We gladly subscribe to this procedure and make all our records available 24 hours a day for the duration of the mandate. The following roll identification items are reported in our Quality Certificate:

Roll number (Prior to Sept 2013)

(example) **202366 -13**

2	0 2	3	6 6	-	1 3
MACH ID	**WEEK**	**DAY OF WEEK (MON = 1)**	**COUNTER FOR WEEK**		**YEAR**

First digit	machine
Second and third digits	week of year
Fourth digit	day of week (Monday=1, Sunday=7)
Last two digits	roll number (first roll of week is 01, etc.)

The two last digits separated from the others indicate the year the roll was produced. Using the above key:
Roll #202366 -13 was produced on Machine #2 on Wed. in the second week in 2013 (1/16/13).

Roll number (After Sept 2013)

(example) **G13E383069**

G	1 3	E	3 8	3	0 6 9
PLANT ID	**YEAR**	**MACHINE ID**	**WEEK**	**DAY OF WEEK (MONDAY = 1)**	**COUNTER FOR WEEK**

First digit	Plant (G=Georgetown / F=Fernley)
Second and Third digits	Year (13 = 2013)
Fourth digit	Machine ID
Fifth & Sixth digits	Week in the current year
Seventh digit	day of week (Monday=1, Sunday=7)
Last three digits	counter for the week (starts at 001)

Using the above key:
Roll #G13E383069 was produced on Georgetown, on Machine E on Wed. in the 38th week in 2013 (9/18/13).

Product Description (liner type: Smooth, Microspike®, Drain®, Super Gripnet®, etc.)

Roll Length & Width in feet / meters, thickness in mils / mm.

Raw material lot and/or batch number and supplier/product identification (from resin manufacturer's Certificate of Analysis – sample attached)

All geomembrane rolls are labeled as follows:

- roll stickers on the cores for each roll
- roll stickers on the outside of the finished roll
- written (Paint Pen) roll numbers on each face (flat ends)
- written (Paint Pen) roll numbers on the outside of the finished roll.

The following test results are reported in the Geomembrane Quality Certificate, derived from our standard test frequency (attached) and/or supplied raw material manufacturer Certificates of Analysis. Tests performed are the latest revisions of the standards listed. At a minimum this meets or exceeds GRI GM 13/17 requirements:

Test / Method	Results Reported & Modifications to Standard (if any)
Thickness †ASTM D5199(Smooth) †ASTM D5994(Textured) **(Both Modified)**	Minimum, Maximum, and Average Sheet Thickness in mm and mils. **Modification from Standard** = Measurements are taken upon sample reaching Lab Temperature Equilibrium.
Asperity Height †ASTM D7466 **(Modified)** Textured liner only	Asperity height in mils **Modifications from Standard** = Edge samples are collected from the smooth/textured junction, **not** 1 foot from edge. ASTM D5994 specimens are used for this test, not direct placement.
Density †ASTM D792 method B	Density in g/cc
Melt Flow Index †ASTM D1238	g/10minutes (Conditions =190°C, 2.16kg). **NOTE:** Resin Manufacturer's **Certificate of Analysis result** is reported. Our testing
Carbon Black Content †ASTM D4218	% Carbon Black by weight
Carbon Black Dispersion †ASTM D5596	Category (Only near spherical agglomerates per GRI GM 13 & 17)
Tensile Strength †ASTM D6693 Type IV, 2 inches / minute **(Modified)**	Average Strength @ Yield & Break in psi, ppi, & N/mm Average Elongation @ Yield & Break in % **Modification from Standard** = Average of MD & TD results are reported **NOTE 1:** The D6693 results equate to the following **NOTE 2:** Yield data not reported for LLDPE
Tear Resistance †ASTM D1004 **(Modified)**	Tear Resistance in Lbs & N. **Modifications from Standard** = Test is run upon sample reaching Lab Temperature Equilibrium. Average Tear Resistance of MD & TD is reported.
Puncture Resistance †ASTM D4833 **(Both Modified)**	Puncture Resistance in Lbs & N. **Modification from Standard** = Test is run upon sample reaching Lab Temperature Equilibrium.
Notched Constant Tensile Load †ASTM D5397 (Single Point, Appx.)	Pass / Fail at 500 hours (or as required by customer specifications). First roll of new resin lot tested. This test is run on HDPE only, and on smooth edge of textured liners.
Oxidative Induction Time (OIT) †ASTM D3895 Standard, 200°C, 1atm.	OIT Time in minutes. **Modification from Standard** = One run only – if result is below 140 minutes, a second run is done to verify the first.

The following test methods are now certified by Agru America based on historical results, as they are not required by the GRI GM13 / 17, and are not considered typical MQC tests.

Test / Method	Results Certified
Low Temperature Brittleness ASTM D746	Pass / Fail for each specimen (5 specimens in both MD & TD), 100 % of samples passing. Results Certified to -80°C (-112°F)
ESCR †ASTM D1693	Pass / Fail for each specimen (5 specimens in both MD & TD), 100 % of samples passing. Results Certified to 2,000 hours
Dimensional Stability †ASTM D1204 **(Modified)**	15 minutes or 1 hour at 100°C Results Certified to ± 2% for all geomembranes

†GRI-LAP Accredited for this method (INCLUDING Modifications)

In addition to the testing described above, an in-house procedure is performed within the smooth edges of Textured (Microspike DS & SS) and Structured (Supergrip, Grip, Drain, MicroDrain) liner by the QC Lab in both plants.

Summarized, the procedure is a modified Graves Tear test (ASTM D1004), testing 2 specimens taken in the cross machine direction, and 2 specimens from the machine direction from within the smooth edges. Both the individual specimen results and the specimens themselves are checked. This test is currently being performed on each test roll (each time a tensile test is performed) produced in both plants.

The average result will be reported on the geomembrane roll Quality Certificates.

In addition to our MQC testing, Agru America will continually strive to produce superior products with isotropic characteristics.

Drainage Net (Geonet)

AGRU America drainage net is made from a blend of high quality HDPE resin and a carbon black masterbatch. The purpose of the carbon black is to protect the plastic from UV damage in the field application.

All raw materials as well as the finished products are consistently monitored by specially trained lab technicians. Raw materials are tested as above for Geomembrane.

The blend of raw materials is plasticized by an extruder, which presses the melt through a screen changer to filter out impurities. The plastic is then fed into a rotating die which creates the net. The cooling of the net takes place in a water tank at a tightly controlled temperature. A series of nip rollers pull the net out of the tank and through the downstream equipment to the winders. The net is cut to length automatically and wound onto a 4" OD cardboard core.

Before the finished rolls are taken out of the winder frame, the quality control technician either releases the material into stock or classifies the material as scrap.

When approved by QC, the rolls are transferred to the storage yard.

Geocomposite

In addition to the drainage net, AGRU America offers geocomposites which consist of geotextiles laminated to one or both sides of the net.

All geotextiles used for this lamination process are being inspected to meet AGRU America's (or project) specifications.

The lamination process takes place just before the net reaches the winders at the end of the extrusion line. After melting the surface of the HDPE drainage net, a geotextile is pressed into the net by means of a calender. The outer 6 inches of net are not laminated and the geotextile overlaps the net by an additional 6 inches on both sides of the product.

Before the finished rolls are taken out of the winder frame, the quality control technician either releases the material into stock or classifies the material as scrap.

When approved by QC, the rolls are stretch wrapped and transferred to the storage yard. All drainage net and geocomposite rolls are labeled as follows:

- one label on each face of the roll
- two hand written roll numbers on the stretch wrap packaging
- one label on the laboratory sample
- numbering system is as above for geomembrane

The following test results are reported in the Geonet/Composite Quality Certificate, derived from our test results and/or supplied raw material manufacturer Certificates of Analysis. Tests performed are the latest revisions of the Standards listed:

Test / Method	Results Reported & Modifications to Standard (if any)
Thickness (Geonet) †ASTM D5199	Minimum, Maximum, and Average Geonet Thickness in mm and mils. **Modification from Standard** = Measurements are taken upon sample reaching Lab Temperature Equilibrium. English Units reported
Density (Geonet) †ASTM D792	Geonet Density in g/cc
Melt Flow Index (Geonet) †ASTM D1238	g/10minutes (Conditions =190°C, 2.16kg). **NOTE:** Resin Manufacturer's **Certificate of Analysis result** is reported. Our testing verifies this result.
Carbon Black Content (Geonet) †ASTM D4218	% Carbon Black by weight
Peak Tensile Strength (Geonet) †ASTM D5035 or †ASTM D7179 **(Both Modified)**	MD Only tested, TD upon request only. Peak Strength @ Break in ppi **Modification from Standard** = English Units reported
Mass Per Unit Area (Geonet) †ASTM D5261	Average Mass per Unit Area in lb/ft^2 **Modification from Standard** = English Units reported
Transmissivity (Geonet) †ASTM D4716	Transmissivity, m^2 / sec Plate to Plate , 21°C, **gradient = 0.1, load = 10,000psf, seat time = 15 minutes** is Agru America's Standard Geonet MQC Transmissivity test (may be changed per project MQC specs)
Transmissivity (Geocomposite) †ASTM D4716	Transmissivity, m^2 / sec Plate to Plate , 21°C, **gradient = 0.1, load = 10,000psf, seat time = 15 minutes** is Agru America's Standard Geocomposite MQC Transmissivity test (may be changed per project MQC specs)
Ply Adhesion (Geocomposite) †ASTM D7005	Peel Strength, lbs/in, min. ave.

†GRI-LAP Accredited for this method (INCLUDING Modifications)

Geomembrane Standard Frequency of Testing

Product Data

Property	Test Method	Frequency of testing (minimum)*
Thickness (min. ave.), mil	ASTM D5994/D5199	per roll
Asperity Height (min. ave.), mil	ASTM D7466	per roll, for textured liner
Density, g/cc, minimum	ASTM D792, Method B	200,000 lbs (railcar) on finished liner & incoming resin
Tensile Properties (ave. both directions)	ASTM D6693, Type IV	
Strength @ Yield (min. ave.), lb/in width	2 in/minute	20,000 lbs
Elongation @ Yield (min. ave.), % (GL=1.3in)	5 specimens in each direction	20,000 lbs
Strength @ Break (min. ave.), lb/in width		20,000 lbs
Elongation @ Break (min. ave.), % (GL=2.0in)		20,000 lbs
Tear Resistance, lbs. (min. ave.)	ASTM D1004	45,000 lbs
Puncture Resistance, lbs. (min. ave.)	ASTM D4833	45,000 lbs
Carbon Black Content (range in %)	ASTM D4218	20,000 lbs
Carbon Black Dispersion (Category)	ASTM D5596	45,000 lbs
Stress Crack Resistance (NCTL), hours	ASTM D5397, Appendix	200,000 lbs (railcar)
Oxidative Induction Time, minutes	ASTM D3895, 200°C, 1 atm O_2	200,000 lbs (railcar) on finished liner
Melt Flow Index, g/10 minutes	ASTM D1238, 190°C, 2.16kg	200,000 lbs (railcar) on incoming resin
Oven Aging with HP OIT, (% retained after 90 days)	ASTM D5721 ASTM D5885, 150°C, 500psi O_2	per resin formulation
UV Resistance with HP OIT, (% retained after 1600 hours)	ASTM D7238 ASTM D5885, 150°C, 500psi O_2	per resin formulation
2% Secant Modulus, lb/in. (max.)	ASTM D5323	per resin formulation-**for LLDPE liner only**
Axi-Symmetric Break Resistance Strain, % (min.)	ASTM D5617	per resin formulation-**for LLDPE liner only**

These test frequencies meet or exceed GRI's GM13 and GM17.
***Theses test frequencies may be changed based on project specifications, and represent the minimum MQC testing performed.**
Additional costs may be incurred if required testing is greater than listed above

ESI: Baton Rouge

Operations Center

Regional offices:
Columbia, SC
Oconomowoc, WI

OUR HISTORY
Founded in 1996.
Full service landfill construction and full service piping company.
Capable of performing civil earthwork construction .
Supply & install leachate collection systems, landfill gas systems and leachate forcemain systems.
A leading geosynthetic installer in the USA.

APPLICATIONS AND SERVICES AREAS ESI WORKS (both LF & Industrial)
Landfill Containment & Capping
Hazardous Waste Containment
Soil Capping Projects
Mining Applications
Tank Farms
Gypsum Stacks
Vapor Barriers
Superfund Sites
Department of Energy Sites (DOE)
US Army Corps of Engineer
Leachate Collection Systems
Leachate Collection Pumping Systems
Manholes, Valve Boxes, Sump Fabrication
Energy Plants
Water Treatment Facilities
Sewage Lagoons
Secondary Containment
Pond Liners
Water Storage Reservoirs
Rain Tarps
Petrochemical Plants
Aquaculture Applications
Paper Mills
Dual Contained Force Main
Riser Pipes

ABOUT US
ESI completes landfill construction, geosynthetic lining systems and multiple HDPE pipe installations with our own forces that operate out of our Baton Rouge, Louisiana operations center.

SAFETY: #1 GOAL
ESI prides itself on its past and current safety record and continually strives to achieve a Zero Accident Rate. ESI's EMR is 0.79

Re: WC Experience Modifiers

Ashton,

Per your request, here are the experience modification rates for Environmental Specialties International, Inc. for the years 2010 – 2014.

4/1/2010	.72
4/1/2011	.72
4/1/2012	.77
4/1/2013	.82
4/1/2014	.79

If you need any further information, please don't hesitate to let me know.

Regards,

Paul R. Owen, CIC, CRM

300 mil Geocomposite

Geonet Component (1)

Property	Test Method	Frequency	Minimum Average Roll Value
Thickness, mil (mm)	ASTM D5199	50,000 sf	300 (7.6)
Peak Tensile Strength MD, lbs./in. (N/mm)	ASTM D5035/7179	50,000 sf	75 (13.3)
Density, g/cm³	ASTM D792, Method B	50,000 sf	0 94
Carbon Black Content (%)	ASTM D4218	50,000 sf	2 - 3
Transmissivity(2), m²/sec. (gal/min/ft)	ASTM D4716	500,000 sf	8×10^{-3} (38.6)

Geotextile Component(1)

Property	Test Method	Frequency	Minimum Average Roll Value		
Mass per Unit Area, oz /sq. yd (g/m²)	ASTM D5261	100,000 sf	6.0 (203)	8 0 (271)	10.0 (339)
Grab Tensile Strength, lbs (N)	ASTM D4632	100,000 sf	170 (757)	220 (979)	270 (1200)
Grab Elongation, %	ASTM D4632	100,000 sf	50	50	50
Trapezoidal Tear, lbs. (N)	ASTM D4533	100,000 sf	65 (289)	95 (423)	105 (467)
CBR Puncture , lbs (N)	ASTM D6241	500,000 sf	435 (1935)	600 (2670)	725 (3230)
Permittivity(3), sec.-1	ASTM D4491	500,000 sf	1.5	1.3	1.1
Water Flow, (3) gpm./ft² (l/min/m²)	ASTM D4491	500,000 sf	110 (4479)	95 (3895)	80 (3280)
AOS, U.S. Sieve max (mm)(3)	ASTM D4751	500,000 sf	70 (0.212)	80 (0.180)	100 (0.150)

Geocomposite

Property	Test Method	Frequency		Minimum Average Roll Value		
Ply Adhesion, lbs./in. (g/cm)	ASTM D7005	50,000 sf		1 (178)	1 (178)	1 (178)
Transmissivity (2), m²/sec. (gal/min/ft)	ASTM D4716	500,000 sf	Double	9×10^{-4} (4.3)	9×10^{-4} (4.3)	7×10^{-4} (3.4)
	ASTM D4716	500,000 sf	Single	3×10^{-3} (14.5)	3×10^{-3} (14.5)	2×10^{-3} (9.6)

Supply Information

Standard Roll Length(4)	at Fabric Weight	6-oz	8-oz	10-oz
Double Sided		160	150	140
Single Sided		180	180	170

Notes:
(1) Component properties are prior to lamination
(2) Geonet & Geocomposite. Transmissivity at 21°C, gradient of 0.1, load of 10,000psf, seat time 15 min. between steel plates.
(3) At time of manufacture. Handling may change these properties.
(4) All roll widths are 14.5 feet. All roll lengths and widths have a tolerance of ±1%
(5) UV Resistance after 500 hours for the geotextile componet exhibits 70% strength retained via ASTM D4355

AGRU AMERICA, INC. - QA/QC

Manufacturing – Quality Assurance/Quality Control

AGRU AMERICA, Inc. extrudes high density polyethylene (HDPE) and linear low density polyethylene (LLDPE) geomembrane, HDPE Geonet, Geocomposite, geotextile and GCL products at its three production plants located at 500 Garrison Road, Georgetown, South Carolina, 29440, 2000 East Newlands Drive, Fernley, Nevada, 89408 and 181 Hwy 521, Andrews SC 29510.

Our USA Manufacturing Quality Assurance Program is dependent on the utilization of in-house laboratories in each plant which are, when necessary, complemented with testing performed by certified outside laboratories such as:

- TRI/Environmental California; Anaheim, CA
  Telephone (714) 520-9631; Fax (714) 520-9637
- TRI/Environmental, Inc.; Austin, Texas
  Telephone (512) 263-2101; Fax (512) 263-2558

  And other GRI-LAP accredited laboratories.

Raw Material – Manufacturer's Certificate of Conformity

HDPE and LLDPE resin is supplied to our plants in bulk and subjected to the following procedures:

- Prior to shipment, our resin supplier submits a certificate of analysis. Once approved, the resin is released for shipment to our plant.
- One sample is taken from each rail car after arrival and tested as follows:
  Melt Index ASTM D1238 190°C, 2.16kg, and Density ASTM D792 Method B.
- Once the tests have been completed and results found to be in compliance with our requirements, the resin is then unloaded into our silo system.
- At this stage, our supplier has performed one battery of tests and Agru America has performed one to verify the manufacturer's certificate of analysis.
- Off specification resin is returned to the supplier.
- The Manufacturer's MFI Test Data is reported on the Geomembrane Quality Certificate (Agru America's MFI Testing is done to verify the resin manufacturer's reported data).

1

GEOMEMBRANE

The Extrusion Process

The resin is conveyed through a vacuum pump system and flexible hoses to a dryer hopper, feeding the resin by gravity into an 8-inch barrel. This barrel is divided into five heating zones, each heating zone being computer controlled and constantly monitored.

A screw in the barrel turns at a prescribed and monitored speed. It conveys the resin slowly to full plastication, and then the plasticated resin is fed through a manifold into a coat hanger die having a width of approximately 24 feet. The die lips are open to a prescribed distance governed by the thickness of the geomembrane to be extruded.

Exiting the die, the plasticated resin forms a controlled and monitored bead, which feeds into a chrome three-roll stack in a prescribed pattern. Each chrome roll is set at a prescribed temperature, controlled by water circulation.

Exiting the controlled cooling of the roll stack, the geomembrane travels down the take off haulers towards the winder. On the way to the take off, the liner is trimmed to bring the finished width to the applicable standard. Trimmings are granulated.

The trimmed edge of one side of the geomembrane is marked every meter (3.28 ft) with thickness, resin type (HDPE or LLDPE), Agru America name, and year of manufacture. This marking also serves as product identification.

The geomembrane is visually inspected for surface defects as it travels down the take off by both the extruder and the winder operators.

The geomembrane is wound on a recycled HDPE core having 6" ID (150mm), 7" OD (175mm) and 22'8" (6.8m) length.

Each standard length roll weighs approximately 3,900 pounds (1770 kg.). Rolls are fitted with two nylon slings when shipped.

Post Extrusion Quality Control

Once start-up conditions are over and commercial extrusion is initiated, post-production quality control comes into operation. A series of test procedures are performed based upon either our standard frequency of testing (attached), or frequencies required by customer specifications.

A sample approximately 11" by the full width of the geomembrane is taken from every roll. Based on the specified test frequencies, certain specimens are die cut, tested, and the results summarized on the Quality Certificate issued by our Quality Control Department. The certificate is signed electronically by the Quality Control Manager. The Quality Control Manager reports directly to the President of the Company.

Rolls failing to comply with either customer project specifications and/or our own latest revision to our published data sheets are set aside and re-classified as off-spec (Class B rolls).

Quality Certificates are provided for all rolls of geomembrane (sample smooth & Microspike® certificates are attached) with the exception of off-spec (Class B rolls).

Sometimes a third party quality assurance representative is mandated by the owner of a project to oversee our manufacturing QA. We gladly subscribe to this procedure and make all our records available 24 hours a day for the duration of the mandate. The following roll identification items are reported in our Quality Certificate:

Roll number (Prior to Sept 2013)

(example) **202366 -13**

2	0 2	3	6 6	-	1 3
MACH ID	WEEK	DAY OF WEEK (MON = 1)	COUNTER FOR WEEK		YEAR

First digit	machine
Second and third digits	week of year
Fourth digit	day of week (Monday=1, Sunday=7)
Last two digits	roll number (first roll of week is 01, etc.)

The two last digits separated from the others indicate the year the roll was produced. Using the above key:
Roll #202366 -13 was produced on Machine #2 on Wed. in the second week in 2013 (1/16/13).

Roll number (After Sept 2013)

(example) **G13E383069**

G	1 3	E	3 8	3	0 6 9
PLANT ID	YEAR	MACHINE ID	WEEK	DAY OF WEEK (MONDAY = 1)	COUNTER FOR WEEK

First digit	Plant (G=Georgetown / F=Fernley)
Second and Third digits	Year (13 = 2013)
Fourth digit	Machine ID
Fifth & Sixth digits	Week in the current year
Seventh digit	day of week (Monday=1, Sunday=7)
Last three digits	counter for the week (starts at 001)

Using the above key:
Roll #G13E383069 was produced on Georgetown, on Machine E on Wed. in the 38th week in 2013 (9/18/13).

3

Product Description (liner type: Smooth, Microspike®, Drain®, Super Gripnet®, etc.)

Roll Length & Width in feet / meters, thickness in mils / mm.

Raw material lot and/or batch number and supplier/product identification (from resin manufacturer's Certificate of Analysis – sample attached)

All geomembrane rolls are labeled as follows:

- roll stickers on the cores for each roll
- roll stickers on the outside of the finished roll
- written (Paint Pen) roll numbers on each face (flat ends)
- written (Paint Pen) roll numbers on the outside of the finished roll.

The following test results are reported in the Geomembrane Quality Certificate, derived from our standard test frequency (attached) and/or supplied raw material manufacturer Certificates of Analysis. Tests performed are the latest revisions of the standards listed. At a minimum this meets or exceeds GRI GM 13/17 requirements:

Test / Method	Results Reported & Modifications to Standard (if any)
Thickness †ASTM D5199(Smooth) †ASTM D5994(Textured) **(Both Modified)**	Minimum, Maximum, and Average Sheet Thickness in mm and mils. **Modification from Standard** = Measurements are taken upon sample reaching Lab Temperature Equilibrium.
Asperity Height †ASTM D7466 **(Modified)** Textured liner only	Asperity height in mils **Modifications from Standard** = Edge samples are collected from the smooth/textured junction, not 1 foot from edge. ASTM D5994 specimens are used for this test, not direct placement.
Density †ASTM D792 method B	Density in g/cc
Melt Flow Index †ASTM D1238	g/10minutes (Conditions =190°C, 2.16kg). **NOTE:** Resin Manufacturer's Certificate of Analysis result is reported. Our testing
Carbon Black Content †ASTM D4218	% Carbon Black by weight
Carbon Black Dispersion †ASTM D5596	Category (Only near spherical agglomerates per GRI GM 13 & 17)
Tensile Strength †ASTM D6693 Type IV, 2 inches / minute **(Modified)**	Average Strength @ Yield & Break in psi, ppi, & N/mm Average Elongation @ Yield & Break in % **Modification from Standard** = Average of MD & TD results are reported **NOTE 1:** The D6693 results equate to the following **NOTE 2:** Yield data not reported for LLDPE
Tear Resistance †ASTM D1004 **(Modified)**	Tear Resistance in Lbs & N. **Modifications from Standard** = Test is run upon sample reaching Lab Temperature Equilibrium. Average Tear Resistance of MD & TD is reported.
Puncture Resistance †ASTM D4833 **(Both Modified)**	Puncture Resistance in Lbs & N. **Modification from Standard** = Test is run upon sample reaching Lab Temperature Equilibrium.
Notched Constant Tensile Load †ASTM D5397 (Single Point, Appx.)	Pass / Fail at 500 hours (or as required by customer specifications). First roll of new resin lot tested. This test is run on HDPE only, and on smooth edge of textured liners.
Oxidative Induction Time (OIT) †ASTM D3895 Standard, 200°C, 1atm.	OIT Time in minutes. **Modification from Standard** = One run only – if result is below 140 minutes, a second run is done to verify the first.

The following test methods are now certified by Agru America based on historical results, as they are not required by the GRI GM13 / 17, and are not considered typical MQC tests.

Test / Method	Results Certified
Low Temperature Brittleness ASTM D746	Pass / Fail for each specimen (5 specimens in both MD & TD), 100 % of samples passing. Results Certified to -80°C (-112°F)
ESCR †ASTM D1693	Pass / Fail for each specimen (5 specimens in both MD & TD), 100 % of samples passing. Results Certified to 2,000 hours
Dimensional Stability †ASTM D1204 **(Modified)**	15 minutes or 1 hour at 100°C Results Certified to ± 2% for all geomembranes

†GRI-LAP Accredited for this method (INCLUDING Modifications)

In addition to the testing described above, an in-house procedure is performed within the smooth edges of Textured (Microspike DS & SS) and Structured (Supergrip, Grip, Drain, MicroDrain) liner by the QC Lab in both plants.

Summarized, the procedure is a modified Graves Tear test (ASTM D1004), testing 2 specimens taken in the cross machine direction, and 2 specimens from the machine direction from within the smooth edges. Both the individual specimen results and the specimens themselves are checked. This test is currently being performed on each test roll (each time a tensile test is performed) produced in both plants.

The average result will be reported on the geomembrane roll Quality Certificates.

In addition to our MQC testing, Agru America will continually strive to produce superior products with isotropic characteristics.

Drainage Net (Geonet)

AGRU America drainage net is made from a blend of high quality HDPE resin and a carbon black masterbatch. The purpose of the carbon black is to protect the plastic from UV damage in the field application.

All raw materials as well as the finished products are consistently monitored by specially trained lab technicians. Raw materials are tested as above for Geomembrane.

The blend of raw materials is plasticized by an extruder, which presses the melt through a screen changer to filter out impurities. The plastic is then fed into a rotating die which creates the net. The cooling of the net takes place in a water tank at a tightly controlled temperature. A series of nip rollers pull the net out of the tank and through the downstream equipment to the winders. The net is cut to length automatically and wound onto a 4" OD cardboard core.

Before the finished rolls are taken out of the winder frame, the quality control technician either releases the material into stock or classifies the material as scrap.

When approved by QC, the rolls are transferred to the storage yard.

Geocomposite

In addition to the drainage net, AGRU America offers geocomposites which consist of geotextiles laminated to one or both sides of the net.

All geotextiles used for this lamination process are being inspected to meet AGRU America's (or project) specifications.

The lamination process takes place just before the net reaches the winders at the end of the extrusion line. After melting the surface of the HDPE drainage net, a geotextile is pressed into the net by means of a calender. The outer 6 inches of net are not laminated and the geotextile overlaps the net by an additional 6 inches on both sides of the product.

Before the finished rolls are taken out of the winder frame, the quality control technician either releases the material into stock or classifies the material as scrap.

When approved by QC, the rolls are stretch wrapped and transferred to the storage yard. All drainage net and geocomposite rolls are labeled as follows:

- one label on each face of the roll
- two hand written roll numbers on the stretch wrap packaging
- one label on the laboratory sample
- numbering system is as above for geomembrane

The following test results are reported in the Geonet/Composite Quality Certificate, derived from our test results and/or supplied raw material manufacturer Certificates of Analysis. Tests performed are the latest revisions of the Standards listed:

Test / Method	Results Reported & Modifications to Standard (if any)
Thickness (Geonet) †ASTM D5199	Minimum, Maximum, and Average Geonet Thickness in mm and mils. **Modification from Standard** = Measurements are taken upon sample reaching Lab Temperature Equilibrium. English Units reported
Density (Geonet) †ASTM D792	Geonet Density in g/cc
Melt Flow Index (Geonet) †ASTM D1238	g/10minutes (Conditions =190°C, 2.16kg). **NOTE:** Resin Manufacturer's **Certificate of Analysis result** is reported. Our testing verifies this result.
Carbon Black Content (Geonet) †ASTM D4218	% Carbon Black by weight
Peak Tensile Strength (Geonet) †ASTM D5035 or †ASTM D7179 **(Both Modified)**	MD Only tested, TD upon request only. Peak Strength @ Break in ppi **Modification from Standard** = English Units reported
Mass Per Unit Area (Geonet) †ASTM D5261	Average Mass per Unit Area in lb/ft^2 **Modification from Standard** = English Units reported
Transmissivity (Geonet) †ASTM D4716	Transmissivity, m^2 / sec Plate to Plate , 21°C, **gradient = 0.1, load = 10,000psf, seat time = 15 minutes** is Agru America's Standard Geonet MQC Transmissivity test (may be changed per project MQC specs)
Transmissivity (Geocomposite) †ASTM D4716	Transmissivity, m^2 / sec Plate to Plate , 21°C, **gradient = 0.1, load = 10,000psf, seat time = 15 minutes** is Agru America's Standard Geocomposite MQC Transmissivity test (may be changed per project MQC specs)
Ply Adhesion (Geocomposite) †ASTM D7005	Peel Strength, lbs/in, min. ave.

†GRI-LAP Accredited for this method (INCLUDING Modifications)

8

Geomembrane
Standard Frequency of Testing

Product Data

Property	Test Method	Frequency of testing (minimum)*
Thickness (min. ave.), mil	ASTM D5994/D5199	per roll
Asperity Height (min. ave.), mil	ASTM D7466	per roll, for textured liner
Density, g/cc, minimum	ASTM D792, Method B	200,000 lbs (railcar) on finished liner & incoming resin
Tensile Properties (ave. both directions)	ASTM D6693, Type IV	
Strength @ Yield (min. ave.), lb/in width	2 in/minute	20,000 lbs
Elongation @ Yield (min. ave.), % (GL=1.3in)	5 specimens in each direction	20,000 lbs
Strength @ Break (min. ave.), lb/in width		20,000 lbs
Elongation @ Break (min. ave.), % (GL=2.0in)		20,000 lbs
Tear Resistance, lbs. (min. ave.)	ASTM D1004	45,000 lbs
Puncture Resistance, lbs. (min. ave.)	ASTM D4833	45,000 lbs
Carbon Black Content (range in %)	ASTM D4218	20,000 lbs
Carbon Black Dispersion (Category)	ASTM D5596	45,000 lbs
Stress Crack Resistance (NCTL), hours	ASTM D5397, Appendix	200,000 lbs (railcar)
Oxidative Induction Time, minutes	ASTM D3895, 200°C, 1 atm O_2	200,000 lbs (railcar) on finished liner
Melt Flow Index, g/10 minutes	ASTM D1238, 190°C, 2.16kg	200,000 lbs (railcar) on incoming resin
Oven Aging with HP OIT, (% retained after 90 days)	ASTM D5721 / ASTM D5885, 150°C, 500psi O_2	per resin formulation
UV Resistance with HP OIT, (% retained after 1600 hours)	ASTM D7238 / ASTM D5885, 150°C, 500psi O_2	per resin formulation
2% Secant Modulus, lb/in. (max.)	ASTM D5323	per resin formulation-**for LLDPE liner only**
Axi-Symmetric Break Resistance Strain, % (min.)	ASTM D5617	per resin formulation-**for LLDPE liner only**

These test frequencies meet or exceed GRI's GM13 and GM17.
***Theses test frequencies may be changed based on project specifications, and represent the minimum MQC testing performed. Additional costs may be incurred if required testing is greater than listed above**

GEOMEMBRANE AND DRAINAGE INSTALLATION SPECIFICATION

The information provided in this manual uses current quality control and quality assurance standards within the geomembrane industry. It is the sole responsibility of the user to determine the suitability and use of the information and/or discusses material (s). Agru America, Inc. is not an installer of Geosynthetics Membranes. This manual is provided only as a guideline and is not meant as an authority. Agru America will not be held liable for the installation of Geosynthetic Membranes by others.

Article I. GENERAL

Section 1.01 SUMMARY

This specification includes furnishing and installing HDPE and LLDPE geomembranes as well as geonets and geocomposite. The HDPE formulated sheet density is 0.940 g/cc or greater. The LLDPE formulated sheet density is ≤0.939 g/cc. Both smooth and textured geomembrane surfaces are included.

Section 1.03 SUBMITTALS

(a) Submit the following to the project engineer or property owner, for review and approval, within a reasonable time, to expedite shipment and/or installation of the Geomembrane:

(i) Documentation of Manufacturer's Qualifications

(ii) Manufacturer's Quality Control Program Manual

(iii) Material Properties Sheet

(iv) Material Sample

(v) Documentation of Installer's qualifications;

1) Submit a list of at least ten facilities completed by installer. (For each installation, provide the name of facility, location, date of installation, type and thickness of geomembrane used and surface area of the installed geomembrane.)

2) Submit resumes or qualifications of the installation supervisor, master seamer and Technicians assigned to this project.

3) Installer's Quality Control Program

(vi) Material and Liner Installation Warranties;

1) Submit a copy of all material warranties.
2) Submit a copy of all liner installation warranties.

(b) Shop Drawings

(i) Submit copies of shop drawings for engineer's approval within a reasonable time. Shop drawings shall show the proposed panel layout identifying seams and details. Seams should generally follow the direction of the slope. Butt seams or roll-end seams should not occur on a slope unless approved by the owner's representative. However, if allowed, these seams should be staggered.

(ii) Placement of geomembrane should not occur until owner's representative has received and approved the shop drawings.

(c) Additional Submittals (To be provided during and after installation is complete.)

(i) Manufacturer's warranty

(ii) Geomembrane installation warranty

(iii) Daily written acceptance of sub-grade surface

(iv) Low-temperature seaming procedures if applicable

(v) Prequalification test seam samples

(vi) Field seam non-destructive test results

(vii) Field seam destructive test results

(viii) Daily field installation reports

(ix) Installation record drawing

Section 1.04 QUALITY CONTROL

(a) Manufacturer's Qualifications: The manufacturer shall have at least five (5) years experience in the manufacturing of the specified or similar geomembrane product and shall have manufactured at least 1,000,000 m^2 (10,000,000 ft^2) of the specified type of geomembrane or a similar product during the last five years.

(b) Installer's Qualifications

(i) The geomembrane installer shall be an approved installer by the manufacturer.

(ii) The geomembrane installer shall have at least three (3) years experience installing the specified or similar geomembrane and shall provide a list outlining at least ten (10) projects totaling 500,000 m^2 (5,000,000 ft^2) of the specified type of geomembrane or similar completed within the past three (3) years.

(iii) A field installation supervisor performs and assumes responsibility throughout the geomembrane installation including geomembrane panel layout, seaming, patching, testing, repairs, and all other outlined responsibilities. The field installation supervisor shall have experience in or supervision in the installation and seaming of at least ten (10) projects totally 500,000 m^2 (5,000,000 ft^2) of geomembrane or the type specified or similar product.

(iv) Seaming shall be performed under the direction of a master seamer (who may also be the field installation supervisor or crew foreman) with seaming experience of a minimum of 300,000 m^2 (3,000,000 ft^2) of the geomembrane type specified or similar product, using the same type of seaming apparatus to be used in the current project. During the seaming, the field installation supervisor and/or master seamer are present.

(v) Qualified technicians employed by the geomembrane installer complete all seaming, patching, testing, and other welding operations.

Section 1.05 DELIVERY, STORAGE AND HANDLING

(a) Manufacturer labels must be on all rolls delivered to the project.

(b) A firmly affixed label attached to the selvage edge, shall clearly state the manufacturer's name, product identification, material thickness, roll number, roll type, roll dimensions and roll weight.

(c) The manufacturer protects the geomembrane from mud, dirt, dust, puncture, cutting or any other damaging or deleterious conditions.

(d) Continuously and uniformly supported, rolls are stored away from high traffic areas on a smooth, level surface. Chocks keep the rolls secure when necessary.

Section 1.06 PROJECT CONDITIONS

Do not install geomembrane in the presence of standing water, while precipitation i s occurring, during excessive winds, or when material temperatures are outside the limits specified in Section 3.02.

Section 1.07 MATERIAL WARRANTY

Material manufacturer shall guarantee material against defects and premature aging from environmental conditions on a pro rata basis for a specified period of time acceptable to owner and manufacturer.

Section 1.08 GEOMEMBRANE INSTALLATION WARRANTY

The geomembrane installer shall guarantee the geomembrane installation against defects in the installation and workmanship for a time period satisfactory to all parties commencing with the date of final acceptance.

Section 1.09 GEOMEMBRANE PRE-CONSTRUCTION MEETING

(a) A pre-construction meeting held at the site prior to installation of the geomembrane will include the geomembrane installer, owner, owner's representative (Engineer and/or CQA Firm), and the earthwork contractor. Topics for this meeting shall include:

(i) Health and Safety

(ii) Lines of authority and communication, resolution of any project document ambiguity.

(iii) Methods for documenting, reporting and distributing documents and reports

(iv) Procedures for packaging and storing archive samples.

(v) Review of time schedule for all installation and testing.

(vi) Review of panel layout and numbering systems for panels and seams including details for marking on geomembrane

(vii) Procedures and responsibilities for preparation and submission of as- built panel and seam drawings

(viii) Temperature and weather limitations, installation procedures for adverse weather conditions, defining acceptable sub grade, geomembrane, or ambient moisture and temperature conditions for working during liner installation

(ix) Sub grade conditions, dewatering responsibilities and sub grade maintenance plan

(x) Deployment techniques including allowable sub grade for the geomembrane

(xi) Plan for controlling expansion/contraction and wrinkling of the geomembrane

(xii) Covering of the geomembrane and cover soil placement

(xiii) Measurement and payment schedules

(xiv) Responsibilities of each party

(b) A designated person will document the meeting and send a copy of the minutes to each person in attendance.

Article II. PRODUCTS

Section 2.01 SOURCE QUALITY CONTROL

(a) Manufacturing Quality Control

(i) The test methods and frequencies used by the manufacturer for quality control/quality assurance of the above geomembrane prior to delivery, shall be in accordance with the latest revision of the GRI GM 13 for HDPE geomembrane or GRI GM 17 for LLDPE geomembrane, or modified as required for project specific conditions.

(ii) The manufacturer's geomembrane quality control certifications, including results of quality control testing of the products, must be supplied to the owner's representative to verify that the materials supplied for the project are in compliance with all product and or project specifications. The certification, signed by a responsible party employed by the manufacturer, such as the QA/QC Manager, production m anager, or technical services manager, includes lot and roll numbers and corresponding shipping information.

(iii) The manufacturer provides production/manufacturing certification that the geomembrane and welding rod supplied for the project are from the same material type and are compatible.

Section 2.02 GEOMEMBRANE

(a) The geomembrane shall consist of new, first quality products designed and manufactured specifically for the purpose of this work. The product will satisfactorily complete testing demonstrating its suitability and durability for the purposes intended. The geomembrane rolls shall be seamless, high density polyethylene (HDPE - Formulated Sheet Density ≥ 0.94g/cc) or linear low density polyethylene (LLDPE - Formulated Sheet Density ≤ 0.939 g/cc) containing no plasticizers, fillers or extenders and shall be free of holes, blisters or contaminants, and leak free verified by 100% in line spark or equivalent testing. The geomembrane supplied is a continuous sheet with no factory seams in rolls. The geomembrane will meet the property requirements as shown in GRI GM13 (HDPE) or GRI GM 17 (LLDPE).

(b) Material conformance testing by the owner's representative, if required, will be conducted using in-plant sampling or as specified for the project.

(c) The geomembrane seams shall meet the property requirements as shown in Section 5 or as required by project specifications.

Article III. EXECUTION

Section 3.01 SUB-GRADE PREPARATION

(a) The sub grade shall be prepared in accordance with the project specifications. The geomembrane sub grade shall be uniform and free of sharp or angular objects that may damage the geomembrane prior to installation of the geomembrane.

(b) The geomembrane installer and owner's representative shall inspect the surface before covering with the geomembrane on each day's operations to verify suitability.

(c) The geomembrane installer and owner's representative shall provide daily a written acceptance of the surface before covering with the geomembrane. During installation, the Installer and owner's representative must ensure daily surface maintenance ensuring sub-grade suitability.

(d) Prior to placement of the geomembrane, the installer and owner's representative must repair all sub grade damaged by construction equipment and deemed unsuitable for geomembrane deployment. The installer and owner's representative provides approval for all repairs. All damage and repair protocol including contractor and Installer responsibilities, are outlined in the preconstruction meeting.

Section 3.02 GEOMEMBRANE PLACEMENT

(a) The owner's representative approves all applicable certifications and quality control certificates within the timeframe specified in the contract documents. If the material does not meet project specifications, the contractor removes it from the work area.

(b) The geomembrane installation must follow the limits shown on the project drawings and essentially as shown on approved Panel Placement Drawings. Submit any changes made to Panel Placement Drawings before deployment of liner materials. The Installer must receive approval for the changes prior to deployment of liner materials.

(c) When temperatures are lower than 0°C (32°F), unless approved by the owner's representative, no geomembrane material can be unrolled and/or deployed. The owner's representative may adjust the minimum temperature for material deployment. The installer and owner's representative defines temperature limitations during the preconstruction meeting. Only deploy the quantity of geomembrane that can be anchored and seamed together in one day.

(d) No vehicular traffic shall travel on the geomembrane other than an approved low ground pressure vehicle or equivalent. The owner's representative may suggest that a test pad simulating the methods to be used and showing no damage to the liner will result, be performed prior to implementation of the proposed method.

(e) Use sand bags or equivalent ballast as necessary temporarily holding the geomembrane material in position under the foreseeable and reasonably expected wind conditions. Sand bag material shall be sufficiently close knit to prevent fines from working through the bags and discharging on the geomembrane.

(f) Installer and owner's representative should not place geomembrane if moisture prevents proper sub grade preparation, panel placement, or panel seaming. Defined in the preconstruction meeting, the moisture limitations provide direction for the installer and owner's representative. Damaged and rejected panels (or portions) shall be marked, removed from the work area, and the removal recorded/documented.

(g) The geomembrane should not "bridge over" voids or low areas in the sub grade. The geomembrane shall rest in intimate contact with the sub grade.

(h) Wrinkles caused by panel placement or thermal expansion should be minimized.

(i) Considerations on site geometry: In general, seams shall be oriented parallel to the line of the maximum slope. In comers and odd shaped geometric locations, minimization of the total length of field seams is required. Seams shall not be located at low points in the sub-grade unless geometry requires seaming at such locations and if approved by the owner's representative.

(j) All panels must overlap prior to the seaming process. This overlap affects a weld and allows for proper testing. In no case shall this overlap be less than 75 mm (3")

(k) Sharp stones or other hard objects that could potentially damage the membrane should not be within 1" (25 mm) of the surface to be lined.

(l) Sub-grade should be firm, unyielding and able to support deployment equipment without damage or rutting to the sub-grade.

Section 3.03 SEAMING PROCEDURES

(a) Cold weather installations should follow guidelines as outlined in GRI GM9.

(b) The seaming process shall not occur when liner temperatures are less than 0°C (32°F) unless the installer and/or owner's representative complies with the following conditions.

(i) The seaming of the geomembrane at material temperatures below 0°C (32° F) only transpires when the geomembrane installer can demonstrate the following to the owner's representative using prequalification test seams.

1) Field seams comply with the project specifications.

2) The safety of the crew ensured.

3) Geomembrane material can be fabricated (i.e. pipe boots, penetrations, repairs. etc.) at sub-freezing temperatures.

(ii) The geomembrane installer shall submit to the owner's representative for approval, detailed procedures for seaming at low temperatures, possibly including the following:

1) Preheating of the geomembrane,

2) Using a tent or other device preventing heat loss during seaming and rapid heat loss subsequent to seaming,

3) Completion of a number of test welds to determine appropriate seaming parameters.

(c) If the geomembrane sheet temperature is above 75° C (170° F) as measured by an infrared thermometer or surface thermocouple, seaming transpires only with the approval by the owner's representative. This approval depends upon the recommendations by the manufacturer and on a field demonstration by the geomembrane installer using prequalification test seams to demonstrate that seams comply with the specification.

(d) Seaming shall primarily be performed using automatic fusion welding equipment and techniques. Use of extrusion welding takes place where fusion welding is not possible such as at pipe penetrations, patches, repairs and short (less than a roll width) runs of seams.

(e) In the case of fish mouths or excessive wrinkles at the seam overlap section, cut along the ridge of the wrinkles on the back into the panel if necessary. Terminate the cut with a keyhole cut (nominal 10 mm (1/2") diameter hole) minimizing the crack/tear propagation. Then, seam the overlay. Patch the key hole cut with an oval or round patch of the same base geomembrane material extending a minimum of 150 mm (6") beyond the cut in all directions.

(f) When extrusion welding 60 mil (1.5mm) or greater HDPE, it is advisable to bevel the top portion of the seam in a lengthwise direction to maximize intimate contact of material and improve continuity of weld.

(g) Prior to seaming, confirm the area for welding is free of moisture, dirt and any foreign matter that can affect the integrity of the weld on an ongoing basis.

(h) Take precaution and safety of the liner technicians, in extreme heat or cold, which can affect the health of the individuals.

(i) Seaming should run through the anchor trench to terminate at the end of the sheet goods.

Section 3.04 PIPE AND STRUCTURE PENETRATION SEALING SYSTEM

(a) Provide penetration-sealing system as shown in the Project Drawings.

(b) Construct all penetrations from the base geomembrane material, flat stock, prefabricated boots and accessories as shown on the Project Drawings. In the case of Structured Liners such as SuperGripNet™, DrainLiner™ or similar materials offered by Agru America, Inc., use the smooth or textured liner of the same density for such fabrications. Weld the pre-fabricated or field fabricated assembly to the geomembrane as shown on the Project Drawings to prevent leakage. Once complete, test the assembly. If the Installer cannot perform the field non-destructive testing, attachments will be field spark tested by standard holiday leak detectors in accordance with ASTMD 6365. Spark testing should be done in areas where both air pressure testing and vacuum testing is not possible.

(i) Equipment for Spark testing shall be comprised of but not limited to; a hand held holiday spark tester, and conductive wand that generates a high voltage.

(ii) The testing steps performed by the geomembrane installer include:

1) Place an electrically conductive tape or wire beneath the seam prior to welding.

2) Complete a calibration test on a trial seam containing a non-welded segment ensuring the identification of such a defect (non-welded segment) under the planned machine settings and procedures.

3) Upon completion of the weld, enable the spark tester and hold approximately 25mm (1 in) above the weld moving slowly over the entire length of the weld in accordance with ASTM 6365. If no spark occurs, the weld is leak free.

(iii) A spark indicates a hole in the seam. The geomembrane installer locates, repairs, and retests the faulty area.

(iv) When flammable gasses are present, use special care and precautions in the area to be tested.

Section 3.05 FIELD QUALITY CONTROL

The owner's representative must receive information prior to all pre qualification and production welding and testing, or as agreed upon in the pre construction meeting.

(a) Prequalification Test Seams

(i) The geomembrane installer tests seams and prepares seams verify seaming parameters (speed, temperature and pressure of welding equipment) are adequate.

(ii) Each welding technician creates seams and tests each in accordance with ASTM D 6392 at the beginning of each seaming period. Welding technicians test the seaming under the same conditions and with the same equipment and operator combination as production seaming. The test seam shall be approximately 3.3 meters (10 feet) long for fusion welding and 1 meter (3 feet) long for extrusion welding with the seam centered lengthwise. At a minimum, each welding technician creates one test seam after seaming 4–6 hours; additional tests may be required with changes in environmental conditions.

(iii) Two 25 mm (1 in) wide specimens shall be die-cut by the geomembrane installer from each end of the test seam. The specimens tested by the geomembrane installer require using a field tension meter testing both tracks for peel strength and shear strength. Each specimen should fail in the parent material and not in the weld, "Film Tear Bond"(FTB). When the seam separation is equal to or greater than 25% of the track width, it is a failed test.

(iv) Tables in Section 6 provide the minimum acceptable seam strength values obtained for all specimens tested. Four specimens out of five must meet the acceptable seam strength values for consideration as passing.

(v) If a test seam fails, the welding technician must immediately conduct an additional test seam. If the additional test seam fails, the welding technician rejects the seaming apparatus. The technician must correct the apparatus deficiencies and produce a successful test seam before using the apparatus for any other/additional production seaming.

(vi) The technician labels a sample from each test seam. The label indicates the date, geomembrane temperature, number of the seaming unit, technician performing the test seam and pass or fail description. The technician then gives the sample to the owner's representative for archiving.

(b) Field Seam Non-destructive Testing

(i) The technician non-destructively tests over the full seam length before the geomembrane installer covers it. Numbered or otherwise designated, each seam's label includes the location, date, test unit, name of tester and outcome of all non-destructive testing. Once recorded, the technician submits the information to the owner's representative.

(ii) Testing should be done as the seaming work progresses, not at the completion of all field seaming, unless agreed to in advance by the owner's representative. All defects found during testing shall be numbered and marked immediately after detection. The technician must repair, retest, and remark all defects indicating the acceptable completion of the repair.

(c) Non-destructive testing shall be performed using vacuum box, air pressure or spark testing equipment.

(d) Experienced technicians familiar with the specified test methods perform all non-destructive tests. The geomembrane installer demonstrates all test methods verifying the validity of said test procedures for the owner's representative.

(e) The geomembrane installer tests all extrusion seams using a vacuum box in accordance with ASTM D 6392 and ASTM D 5641 and the following equipment and procedures:

(i) Equipment for testing extrusion seams is not limited to but should include:

1) Vacuum box assembly consisting of a rigid housing
2) Transparent viewing window
3) Soft rubber gasket attached to the base
4) Port hole or valve assembly and a vacuum gauge
5) Vacuum pump assembly equipped with a pressure controller and pipe connections
6) Rubber pressure/vacuum hose with fittings and connections
7) Plastic bucket
8) Wide paintbrush or mop
9) Soapy solution

(ii) The geomembrane installer must charge the vacuum pump and adjust the tank pressure to approximately 35 kPa (5 psig).

(iii) The geomembrane installer shall create a leak tight seal between the gasket and geomembrane interface by wetting a strip of geomembrane approximately 0.3m (12 in) by 1.2m (48 in) (length and width of box) with a soapy solution, placing the box over the wetted area, and then compressing the box against the geomembrane. The geomembrane installer shall then close the bleed valve, open the vacuum valve, maintain initial pressure of approximately 35 kPa (5 psig) for approximately 3-4 seconds. The Installer must continuously examine the geomembrane through the viewing window for the presence of soap bubbles, indicating a leak. If no bubbles appear after 3-4 seconds, consider the area leak free. Once the area is leak free, depressurize the box and move it over the next adjoining area with an appropriate overlap and the process repeated.

(iv) All areas where soap bubbles appear shall be marked, repaired and then retested.

(v) At seam locations where the Installer is unable to non-destructively test, such as pipe penetrations, the Installer must substitute altemate non-destructive spark testing or equivalent.

(vi) All seams that are vacuum tested shall be marked with the date tested, the name of the technician performing the test and the results of the test.

(f) Double Fusion seams with an enclosed channel shall be air pressure tested by the geomembrane installer in accordance with ASTM D5820 and ASTM D6392 and the following equipment guidelines and procedures.

(i) Equipment for testing double fusion seams shall be comprised of but not limited to: an air pump equipped with a pressure gauge capable of generating and sustaining a pressure of 210 kPa (30 psig), mounted on a cushion to protect the geomembrane; and a manometer equipped with a sharp hollow needle or other approved pressure feed device.

(ii) The geomembrane installer completes all testing activities. Both ends of the seam to be tested are sealed and a needle or other approved pressure feed device inserted into the tunnel created by the double wedge fusion weld. The air pump shall be adjusted to a pressure of 210 kPa (30 psig), and the valve closed. Allow 2 minutes for the injected air to come to equilibrium in the channel, and sustain pressure for 5 minutes.

(g) If pressure loss does not exceed 28 kPa (4 psig) after the five-minute period, the Installer considers the seam leak tight. Release pressure from the opposite end verifying pressure drop on needle to ensure testing of the entire seam. The needle or other approved pressure feed device shall be removed and the feedhole sealed.

(i) If loss of pressure exceeds 28 kPa (4 psig) during the testing period or pressure does not stabilize, the geomembrane installer locates, repairs and retests the faulty area.

(ii) Record all results of the pressure testing on the liner at the seam tested and on a pressure testing record.

(iii) If release of pressure from opposite end of tested seam does NOT deflate seam, the Installer takes measures to determine the cause and remedies to air test 100% of the seam under scrutiny.

(h) Destructive Field Seam Testing

(i) The Installer analyzes one destructive test sample per 150 linear m (500 linear ft) seam length or the geomembrane installer shall take another predetermined length in accordance with GRI GM 14 from a location specified by the owner's representative. The geomembrane installer receives the sample locations without advance notice of the locations. The geomembrane installer cuts samples as directed by the owner's representative before the complete installation and as seaming progresses.

(ii) All field samples shall be marked with their sample number and seam number including the sample number, date, time, location, and seam number recorded. The geomembrane installer shall repair all holes in the geomembrane resulting from obtaining the seam samples. All patches shall be vacuum box tested or spark tested. If the installation of a permanent patch over the test location the same day of sample collection is not possible, place a temporary patch either tack welded or hot air welded over the opening until affixing a permanent patch.

(iii) Testing requires the destructive samples size at least 300 mm (12") wide, 1m (36") long, with the seam centered lengthwise. The sample shall be cut into three equal sections and distributed as follows: one section given to the owner's representative as an archive sample; one section given to the owner's representative for laboratory testing as specified in paragraph 5 below; and one section retained by the geomembrane installer for field testing as specified in paragraph 4 below.

(iv) For field-testing, the geomembrane installer shall cut 10 identical 25 mm (1") wide replicate specimens from his sample. The geomembrane installer shall test five specimens for seam shear strength and five for peel strength. The geomembrane installer performs peel tests on both the inside and outside weld tracks. To be acceptable, four (4) of five (5) test specimens must pass the stated criteria in section 2.02 with less than 25% separation. If four (4) of five (5) specimens pass, the sample qualifies for testing by the testing laboratory if required.

(v) If the specifications require an independent seam testing, conduct the testing in accordance with ASTM 5820 or ASTM D6392.

(vi) Prepare and submit all reports of the results of examinations and testing to the owner's representative.

(vii) For field seams, if a laboratory test fails, it is an indicator of the possible inadequacy of the entire seamed length corresponding to the test sample. The geomembrane installer should take additional destructive test portions at locations indicated by the Engineer; (typically 3 m (10 ft) on either side of the failed sample) and perform additional laboratory seam tests. Passing tests shall be an indicator of adequate seams. Failing tests shall be an indicator of non-adequate seams. When seams fail the destructive test, the Installer re-seams or repairs seams with a cap-strip. Cap-strip seams shall be non- destructively vacuum box tested until achieving adequacy of the seams. The geomembrane installer must destructively test all Cap strip seams exceeding 50 M in length (150 FT).

(viii) The Installer keeps all samples out of critical areas such as in the bottom of ponds and other locations such as slopes and sumps.

(i) Identification of Defects

(i) The Installer and owner's representative inspects panels and seams during and after panel deployment to identify all defects, including holes, blisters, un-dispersed raw materials and signs of contamination by foreign matter.

(j) Evaluation of Defects: The Installer must complete a non-destructive test for each suspect location on the liner (both in seam and non-seam areas) using one of the methods described in Section 3.05.B. Each location failing non-destructive testing is marked, numbered, measured and posted on the daily "installation" drawings and subsequently repaired.

(i) If a destructive sample fails the field or laboratory test, the geomembrane installer shall repair the seam between the two nearest passed locations on both sides of the failed destructive sample location.

(ii) All repairs of defective seams, tears or holes use either re-seaming or applying an extrusion welded cap strip process.

(iii) Re-seaming may consist of either:

1) Removing the defective weld area and re-welding the parent material using the original welding equipment; or

2) Re-seam the defective weld area by extrusion welding along the overlap at the outside seam edge left by the fusion welding process.

3) Cap stripping entire faulty seam.

(iv) The Installer repairs blisters, larger holes, and contamination by foreign matter using required patches and/or extrusion weld beads. Each patch shall extend a minimum of 150 mm (6 in) beyond all edges of the defects.

(v) Locate, measure and record all repairs.

(k) Verification of Repairs on Seams: Each repair requires a non-destructive test using either vacuum box or spark testing methods. An indication of a successful repair includes areas passing the non-destructive test. Areas failing the tests require re-seaming and retesting until results show a passing test. Requirements for areas failing the tests include re-seaming and retesting until passing test results. The Installer records the number, date, location, technician and test outcome of each patch.

(l) Daily Field Installation Reports: At the beginning of each day's work, the Installer shall provide the Engineer with daily reports for all work accomplished on the previous workday. Reports shall include the following:

(i) Total amount and location of geomembrane placed

(ii) Total length and location of seams completed, name of technicians doing seaming and welding unit numbers

(iii) Drawings of the previous day's installed geomembrane showing panel numbers, seam numbers and locations of non-destructive and destructive testing

(iv) Results of pre-qualification test seams

(v) Results of non-destructive testing

(vi) Results of vacuum testing of repairs

(m) Prior to covering the liner, report all Destructive test results.

(n) Perform and complete all quality assurance no more than 72 hours after geomembrane deployment.

Section 3.06 LINER ACCEPTANCE

The owner's representative accepts the geomembrane liner when:

(a) The entire installation is completed or an agreed upon subsection of the installation is finished.

(b) The Installer submits all completed QC documentation to the owner.

(c) Verification of the adequacy of all field seams and repairs and associated geomembrane testing is complete.

(d) All submittals are accepted.

Section 3.07 ANCHOR TRENCH

Construct as specified on the project drawings.

Section 3.08 DISPOSAL OF SCRAP MATERIALS

(a) On completion of installation, the geomembrane installer shall dispose of all trash and scrap material in a location approved by the Owner, remove equipment used in connection with the work herein, and shall leave the premises in a neat acceptable manner. Finally, remove all scrap material from the surface of the geomembrane.

Article IV. MEASUREMENT AND PAYMENT

The project specifications document/outline the required measurements and payment of services. All parties sign all documents prior to project start up.

Article V. GEOTEXTILES, GEONETS AND GEOCOMPOSITES

Section 5.01 GEOTEXTILES

The general arrangement of Geotextiles includes aligning seams parallel to the prevailing slope and seams finished by either heat seaming with an approved hand held or self motivated thermal device or by sewing with a stitching approved by the engineer. Whichever stitching method is used, the thread should be compatible with the fabric and have similar chemical resistance to the liner used.

Section 5.02 GEONET

Geonet may be butt joined or lapped if specified. At five-foot 1.5m (5') intervals along the edge, the Installer applies Nylon/plastic cable ties to the net edge. Complete end splices as follows:

(a) On slopes, the ends will overlap two feet 2' (0.6m) with uphill panels on top and two (2) rows of cable ties applied at 6" spacing or per engineers specification.

(b) In flat areas, the ends will overlap a minimum to six inches 6" (15 cm) and one (1) row of three (3) cable ties applied.

Section 5.03 GEOCOMPOSITES

Geocomposites can overlap with the net portion tied and the Geotextile portion thermally bonded or seamed as required by the project specifications.

Section 5.04 REPAIRS

Repair any holes, tears, or burns through the Geotextile from thermal seaming by patching with the same Geotextile. The patch will be a minimum of twelve inches 12" (30cm) larger – in all directions – than the area repaired and will be spot bonded thermally. Repair all geonet holes and/or tears using a patch of the same geonet. Patches are a minimum of twelve inches 12" (30cm) larger in all directions than the area repaired. Tie the patch in place using a minimum of four (4) nylon cable ties.

6.0 - TABLES

"This section shall include the current GRI GM13 (HDPE) or GRI GM17 (LLDPE) manufacturer's specification or a revision of GRI GM13 (HDPE) or GRI GM 17 (LLDPE) specific to the unique project requirements and/or standards, as determined by the owner or owners' agent." TO BE INSERTED BY COMPANY PREPARING SUBMITTALS TO GUARANTEE MOST CURRENT GRI SPECIFICATION.

SEAM STRENGTHS - HDPE and LLDPE GRI GM 19

TABLE 1: Seam Strength and related Properties of Thermally Bonded Smooth and Textured High Density Polyethylene (HDPE) Geomembrane (English Units)

Geomembrane Nominal	30 mils	40 mils	50 mils	60 mils	80 mils	100 mils	120 mils
Hot Wedge Seams (1)							
shear strength(2), lb/in.	57	80	100	120	160	200	240
shear elongation at	50	50	50	50	50	50	50
peel strength (2), lb/in.	45	60	76	91	121	151	181
peel separation, %	25	25	25	25	25	25	25
Extrusion Fillet Seams							
shear strength(2), lb/in.	57	80	100	120	160	200	240
shear elongation at	50	50	50	50	50	50	50
peel strength (2), lb/in.	39	52	65	78	104	130	156
peel separation, %	25	25	25	25	25	25	25

Notes for Table 1 – (Used also for hot air and ultrasonic seaming methods.)

(a) Value listed for shear and peel strength are for 4 out of 5 test specimens; the 5th specimen can be low as 80% of the listed values

(b) Elongation measurements should be omitted for field testing

TABLE 2: Seam Strength and related Properties of Thermally Bonded Smooth and Textured Linear Low Density Polyethylene (LLDPE) Geomembrane (English Units)

Geomembrane Nominal	30 mils	40 mils	50 mils	60 mils	80 mils	100 mils	120 mils
Hot Wedge Seams (1)							
shear strength(2), lb/in.	45	60	75	90	120	150	180
shear elongation at	50	50	50	50	50	50	50
break(3) , %	38	50	63	75	100	125	150
peel strength (2), lb/in.	25	25	25	25	25	25	25
peel separation, %							
Extrusion Fillet Seams (1)							
shear strength(2), lb/in.	45	60	75	90	120	150	180
shear elongation at	50	50	50	50	50	50	50
break(3) %	34	44	57	66	88	114	136
peel strength (2), lb/in.	25	25	25	25	25	25	25
peel separation, %							

Notes for Table 2 - Also for hot air and ultrasonic seaming methods

(i) Value listed for shear and peel strength are for 4 out of 5 test specimens; the 5th specimen can be low as 80% of the listed values

(ii) Elongation measurements should be omitted for field testing

Non-Destructive Air Channel Test

Table 3: Initial Pressure Schedule

Field Testing		
Material	Minimum PSI	Maximum PSI
30 mil	15	30
40 mil	20	30
60 mil	24	30
80 mil	24	30
100 mil	24	32

Table 4: Maximum Allowable Pressure Drop

Material Field Test (after five minutes) 30 mil 4 PSI

40 mil 4 PSI

60 mil 4 PSI

80 mil 4 PSI

100 mil 4 PSI

Note: At all times before heat sealing the end of the seam, the operator should insure that the void or air channel is free of obstruction.

Geocomposite Quality Certification — DOUBLE SIDED COMPOSITE

Customer: Environmental Specialties
PO#: 22077 Savannah River Nuclear Site
Destination: Aiken, SC
doc #: 30000

Agru America
500 Garrison Road
Georgetown, SC 29440
ph: 843-546-0600

Quality Control Manager

agru america quality control dept

Agru America certifies the following results for the above project:

ESI Savannah River Nuclear doc 30000 TEX06M component (009684)

Geocomposite Quality Certification — DOUBLE SIDED COMPOSITE

Customer: Environmental Specialties
PO#: 22077 Savannah River Nuclear Site
Destination: Aiken, SC
doc #: 30000

Agru America
500 Garrison Road
Georgetown, SC 29440
ph: 843-546-0600

Quality Control Manager

agru america quality control dept

Agru America certifies the following results for the above project:

ESI Savannah River Nuclear doc 30000 TEX06M component (009684)

Geocomposite Quality Certification — DOUBLE SIDED COMPOSITE

Customer: Environmental Specialties
PO#: 22077 Savannah River Nuclear Site
Destination: Aiken, SC
doc #: 30000

Agru America
500 Garrison Road
Georgetown, SC 29440
ph: 843-546-0600

Quality Control Manager

agru america quality control dept

Agru America certifies the following results for the above project:

ESI Savannah River Nuclear doc 30000 TEX06M component (009684)

Geocomposite Quality Certification

DOUBLE SIDED COMPOSITE

Customer: Environmental Specialties
PO#: 22077 Savannah River Nuclear Site
Destination: Aiken, SC
doc #: 30000

Agru America
500 Garrison Road
Georgetown, SC 29440
ph: 843-546-0600

Quality Control Manager

agru america quality control dept

Agru America certifies the following results for the above project:

ESI Savannah River Nuclear doc 30000 TEX06M component (009684)

Geocomposite Quality Certification — **DOUBLE SIDED COMPOSITE**

Customer: Environmental Specialties
PO#: 22077 Savannah River Nuclear Site
Destination: Aiken, SC
doc #: 30000

Agru America
500 Garrison Road
Georgetown, SC 29440
ph: 843-546-0600

Quality Control Manager

agru america quality control dept

Agru America certifies the following results for the above project:

ESI Savannah River Nuclear doc 30000 TEX06M component (009684)

Geocomposite Quality Certification

DOUBLE SIDED COMPOSITE

Customer: Environmental Specialties
PO#: 22077 Savannah River Nuclear Site
Destination: Aiken, SC
doc #: 30000

Agru America
500 Garrison Road
Georgetown, SC 29440
ph: 843-546-0600

Quality Control Manager

agru america quality control dept

Agru America certifies the following results for the above project:

ESI Savannah River Nuclear doc 30000 TEX06M component (009684)

PURCHASE ORDER NUMBER; PO#009665 2 OF 6 AUGUST
SHIP TO LOCATION: AGRU/AMERICA, GEORGETOWN, SC 29440
CONTAINER; **FPAX980026**

POLYMER; POLYETHYLENE
PRODUCT TYPE; HDPE
PRODUCT CODE; HD252BP PRIME HDPE COPOLYMER
LOT#; API 15G1310
QUANTITY (ACTUAL); 199,100 lbs.
SHIP DATE; 8-10-15
CARRIER; CSX TO GEORGETOWN
MELT INDEX ASTM D1238; 0.36 GM/10 MIN.
DENSITY, ASTM D1505; 0.9534 GM/CM3

This is to certify that this material satisfies specifications set forth by AGRU/AMERICA and agreed to by API Resin.

Geocomposite Quality Certification

DOUBLE SIDED COMPOSITE

Customer: Environmental Specialties
PO#: 22077 Savannah River Nuclear Site
Destination: Aiken, SC
doc #: 30000

Agru America
500 Garrison Road
Georgetown, SC 29440
ph: 843-546-0600

Quality Control Manager

agru america quality control dept

Agru America certifies the following results for the above project:

ESI Savannah River Nuclear doc 30000 TEX06M component (009684)

Geocomposite Quality Certification

DOUBLE SIDED COMPOSITE

Customer: Environmental Specialties
PO#: 22077 Savannah River Nuclear Site
Destination: Aiken, SC
doc #: 30000

Agru America
500 Garrison Road
Georgetown, SC 29440
ph: 843-546-0600

Quality Control Manager

Agru America certifies the following results for the above project:

ESI Savannah River Nuclear doc 30000 TEX06M component (009684)

Geocomposite Quality Certification

DOUBLE SIDED COMPOSITE

Customer: Environmental Specialties
PO#: 22077 Savannah River Nuclear Site
Destination: Aiken, SC
doc #: 30000

Agru America
500 Garrison Road
Georgetown, SC 29440
ph: 843-546-0600

Quality Control Manager

Agru America certifies the following results for the above project:

ESI Savannah River Nuclear doc 30000 TEX06M component (009684)

Geocomposite Quality Certification

DOUBLE SIDED COMPOSITE

Customer: Environmental Specialties
PO#: 22077 Savannah River Nuclear Site
Destination: Aiken, SC
doc #: 30000

Agru America
500 Garrison Road
Georgetown, SC 29440
ph: 843-546-0600

Quality Control Manager

agru america quality control dept

Agru America certifies the following results for the above project:

ESI Savannah River Nuclear doc 30000 TEX06M component (009684)

Geocomposite Quality Certification

DOUBLE SIDED COMPOSITE

Customer: Environmental Specialties
PO#: 22077 Savannah River Nuclear Site
Destination: Aiken, SC
doc #: 30000

Agru America
500 Garrison Road
Georgetown, SC 29440
ph: 843-546-0600

Quality Control Manager

agru america quality control dept

Agru America certifies the following results for the above project:

ESI Savannah River Nuclear doc 30000 TEX06M component (009684)

Geocomposite Quality Certification

DOUBLE SIDED COMPOSITE

Customer: Environmental Specialties
PO#: 22077 Savannah River Nuclear Site
Destination: Aiken, SC
doc #: 30000

Agru America
500 Garrison Road
Georgetown, SC 29440
ph: 843-546-0600

Quality Control Manager

Agru America certifies the following results for the above project:

ESI Savannah River Nuclear doc 30000 TEX06M component (009684)

Geocomposite Quality Certification

DOUBLE SIDED COMPOSITE

Customer: Environmental Specialties
PO#: 22077 Savannah River Nuclear Site
Destination: Aiken, SC
doc #: 30000

Agru America
500 Garrison Road
Georgetown, SC 29440
ph: 843-546-0600

Quality Control Manager

Agru America certifies the following results for the above project:

ESI Savannah River Nuclear doc 30000 TEX06M component (009684)

Dear Mr. Vidrine:

Thank you for consulting TRI/Environmental, Inc. (TRI) for your geosynthetics testing needs.
TRI is pleased to submit this final report of the laboratory testing for the sample(s) listed below.

Project:	**Savannah River Site**
TRI Job Reference Number:	E2401-77-02
Material(s) Tested:	Five, Agru 6 oz Nonwoven Geotextile(s) - Component for Composite
Test(s) Requested:	Mass/Unit Area (ASTM D 5261)

If you have any questions or require any additional information, please call us at 1-800-880-8378

Sincerely,

Jarrett A. Nelson
Technical Director
Geosynthetic Services Division

Dear Mr. Vidrine:

Thank you for consulting TRI/Environmental, Inc. (TRI) for your geosynthetics testing needs.
TRI is pleased to submit this final report of the laboratory testing for the sample(s) listed below.

Project:	**Savannah River Site**
TRI Job Reference Number:	E2401-78-06
Material(s) Tested:	Ten, Agru 6 oz Nonwoven Geotextile(s) - Component for Composite
Test(s) Requested:	Mass/Unit Area (ASTM D 5261)

If you have any questions or require any additional information, please call us at 1-800-880-8378

Sincerely,

Jarrett A. Nelson
Technical Director
Geosynthetic Services Division
www.GeosyntheticTesting.com

Dear Mr. Vidrine:

Thank you for consulting TRI/Environmental, Inc. (TRI) for your geosynthetics testing needs.
TRI is pleased to submit this final report of the laboratory testing for the samples listed below.

Project:	**Savannah River Site**	
TRI Job Reference Number:	E2402-05-06	
Materials Tested:	Two Agru 6-300-6 Double Sided Geocomposite	
Tests Requested:	Transmissivity (ASTM D 4716) - GC Peel Strength (ASTM D 7005) - GC Thickness (ASTM D 5199) - GN	<===Updating

If you have any questions or require any additional information, please call us at 1-800-880-8378

Sincerely,

Mansukh Patel
Laboratory Manager
Geosynthetic Services Division

Dear Mr. Vidrine:

Thank you for consulting TRI/Environmental, Inc. (TRI) for your geosynthetics testing needs.
TRI is pleased to submit this final report of the laboratory testing for the sample(s) listed below.

Project:	**Savannah River Site**
TRI Job Reference Number:	E2402-09-09
Material(s) Tested:	Three, Agru 6-300-6 Double Sided Geocomposite(s)
Test(s) Requested:	Peel Strength (ASTM D 7005) - GC Thickness (ASTM D 5199) - GN

If you have any questions or require any additional information, please call us at 1-800-880-8378

Sincerely,

Jarrett A. Nelson
Technical Director
Geosynthetic Services Division

Dear Mr. Vidrine:

Thank you for consulting TRI/Environmental, Inc. (TRI) for your geosynthetics testing needs.
TRI is pleased to submit this final report of the laboratory testing for the sample(s) listed below.

Project:	**Savannah River Site**
TRI Job Reference Number:	E2402-11-03
Material(s) Tested:	One, Agru 6-300-6 Double Sided Geocomposite(s)
Test(s) Requested:	Peel Strength (ASTM D 7005) - GC Thickness (ASTM D 5199) - GN

If you have any questions or require any additional information, please call us at 1-800-880-8378

Sincerely,

Mansukh Patel
Laboratory Manager
Geosynthetic Services Division

Dear Mr. Vidrine:

Thank you for consulting TRI/Environmental, Inc. (TRI) for your geosynthetics testing needs.
TRI is pleased to submit this final report of the laboratory testing for the samples listed below.

Project:	**Savannah River Site**
TRI Job Reference Number:	21687
Materials Tested:	One Agru Double Sided Geocomposite and GCL
Tests Requested:	Transmissivity (ASTM D 4716) - GC

If you have any questions or require any additional information, please call us at 1-800-880-8378

Sincerely,

Mansukh Patel
Laboratory Manager
Geosynthetic Services Division

SUBJECT: NON-GCL/GDL TESTING LABORATORY INFORMATION FOR THE SAVANNAH RIVER 488-2D/4D ASH BASIN CLOSURE PROJECT SUBCONTACT NO.196912

Dear Mr. Hunter,
Envirocon respectfully submits, pursuant with Exhibit E Specifications Part 1, Section 01410, Sub-Section 1.8E, the attached information regarding the proposed Testing Laboratory concerning all non-GCL/GDL testing for the Savannah River 488-2D/4D Ash Basin Closure Project.

If you have any questions, please contact me at 509-308-4734.

Sincerely,

Drew White
Project Manager

Project Construction Testing and Quality Assurance Plan

February 16, 2015

Project: Ash Landfill Closure

Location: Savannah River Site, Aiken Co., SC

Contractor/Client: Envirocon
101 International Drive
Missoula, MT 59808
(406) 523-1150

Project Description

All tests will be performed in accordance with all applicable ASTM Standards and all QA requirements therein.

Laboratory Reports

The testing laboratory will submit one (1) copy of laboratory reports to Envirocon as specified in Section 01410. The laboratory report will include the following information:

- Date Issued
- Project Number
- Name of Inspector
- Date and Time of Sampling or Inspection
- Identification of Product and Specifications Section
- Location of the project
- Types of Inspection or Test
- Date of Test
- Location and/or boundaries of the specified inspection or test
- Conformance with Subcontract Documents

Laboratory Qualifications

This laboratory meets the requirements of:

ASTM E329	Standard Specification for Agencies Engaged in the Testing and/or Inspection of Materials Used in Construction
ASTM D3740	Evaluation of Agencies Engaged in the Testing and/or Inspection of Soil and Rock as Used in Engineering Design and Construction.
ASTM C1077	Standard Practice for Laboratories Testing Concrete and Concrete Aggregates for Use in Construction and Criteria for Laboratory Evaluation

Professional Engineers, James M. Pope (P.E. Georgia 6271 and South Carolina No. 3665) and Jon E. Pruett (P.E. Georgia No. 027602 and South Carolina No. 20965 and) are employed by CSRA Testing and Engineering Company, Inc., to oversee all projects and have current engineering licenses.

CSRA Testing and Engineering Company, Inc., is currently licensed in Georgia and South Carolina. Please see attached "Statement of Qualifications and Experience" for additional information on this firm and resumes of key personnel.

Management

All work on this project will be under the direction of James M. Pope, Professional Engineer, with Georgia License Number 6271.

The Laboratory Supervisor on this project will be Jeffery S. Pope with 25 years experience and with the following credentials:

- NICET-Engineering Technologies, Construction Level III, Subsurface Investigation Level II & Lab Level III
- American Concrete Institute (ACI) Technician Grade I
- Troxler Training Course - Nuclear Testing Equipment Certificate
- OSHA Forty-Hour Hazardous Waste and Emergency Response Course
- International Code Council - Structural Masonry Special Inspector
- American Concrete Institute (ACI) - Concrete Construction Special Inspector
- GA DOT Roadway Testing Technician

An inspector, or technician, will be assigned to this project having adequate training and experience in concrete sampling and testing and soil compaction and analysis in accordance with ASTM E329.

Quality System

The testing laboratory has begun a program to document the elements of this quality system and this documentation is available for use by all laboratory personnel. The testing laboratory has defined and documented its policies and objectives for, and its commitment to good laboratory practice and quality of calibration or testing services. The laboratory management ensures that these policies and objects are documented in a quality manual and communicated to, understood, and implemented by all laboratory personnel concerned. The quality manual is maintained under the responsibility of the laboratory supervisor.

All equipment is calibrated in accordance with the appropriate ASTM test designation. Records of these calibrations is kept in files and under the administration of the laboratory supervisor. All measuring and testing equipment having an effect on the accuracy or validity of calibrations or tests is calibrated and/or verified before being put into service. The laboratory has an established program for the calibration and verification of its measuring and test equipment.

The overall program of calibration and/or verification and validation of equipment is designed and operated so as to ensure that, wherever applicable measurements made by the laboratory are traceable to national standards of measurements where available as stated in QA manual.

Where traceability to national standards of measurement is not applicable, the laboratory will endeavor to provide satisfactory evidence of correlation of results.

Reference standards of measurements are calibrated by a body that can provide traceability to a national standard of measurement. There is a program of calibration and verification for referenced standards.

Where relevant, reference standards and measuring and testing equipment is subjected to in-service checks between calibrations and verifications.

Reference materials can, where possible, be traceable to national or international standards of measurement, or to a national or international standard reference materials.

Should calibration procedures reveal that a piece of equipment was not in proper calibration and that this lack of calibration could have caused past test reports to be significantly incorrect, the testing laboratory will immediately notify all clients that would be affected by this our of calibration deficiency.

The laboratory manager will make a comprehensive search of all project files to ensure that every client who may be effected is notified.

The laboratory maintains a record system to suit its particular circumstances and comply with any applicable regulations. It retains on record all original observations, calculations and derived data, calibration records and a copy of the calibration certificate, test certificate, or test reports for an appropriate period. The records of each calibration and test contains sufficient information to permit this repetition. The records include the identity of personnel involved in sampling, preparation, calibration or testing.

All records (including those pertaining to calibration and test equipment), certificates and reports are safely stored.

Procedure

All testing work will be performed at the direction of Envirocon under the supervision of James M. Pope, P.E.

All testing procedures will be in strict accordance with applicable ASTM Standards, supervised by Jeffery S. Pope, Laboratory Supervisor, and performed by a trained technician.

Test reports will be supplied to Envirocon for all tests performed or inspections made.

It will be the responsibility of the testing laboratory to ensure that it performs only tests and inspections, or both, for which it is adequately equipped and staffed, and that its employees perform only tests and inspections, or both, for which they are adequately trained.

The following duties are those usually performed by the testing laboratory.

1) Obtain representative samples of these materials required by project specifications, and authorized by contract, to be tested and evaluated.

2) When samples are collected by this firm, we will ensure that there is proper protection, handling and storing of the samples to ensure that they remain representative of the material being used at the time of sampling.

3) When the testing laboratory is responsible for collecting samples the samples must be identified with the respective portions of the work in which the material represented was or will be used.

4) Perform all testing and inspection operations in accordance with appropriate standards as referenced in the contract.

5) Call to the attention of the project sponsor any irregularities or deficiencies in the construction materials or processes, or both, as related to construction materials, that the contract specifically states the testing laboratory is responsible for inspecting.

6) Submit promptly to the project sponsor and distribute as specified in the contract formal reports of all tests and inspections which indicate compliance or noncompliance with the specifications. The reports will be complete and factual, citing the methods used in obtaining samples, the tests performed, the specified values for the measured characteristics, the values obtained, the parts of the structure involved, and similar pertinent data. We will be prepared to substantiate its reports to the extent necessary.

Unless specifically authorized, the testing laboratory does not have the right of rejection.

James M. Pope, P.E., President — Date 2-16-15

Jeffery S. Pope, Laboratory Manager — Date 2-16-15

Introduction

ORGANIZATION

CSRA Testing and Engineering Company, Inc., was founded in Augusta, Georgia in 1968. Since that time our company has continuously strived to provide professional testing and engineering services with the highest possible degree of quality assurance.

We provide an extensive range of services, including subsurface investigations, environmental investigations, and selective analytical laboratory analysis. We provide well equipped drilling crews to perform geotechnical and environmental borings. Our construction testing department is highly diversified, providing on-site construction inspections and testing of soils, concrete, asphalt, and aggregates. We also supply concrete or asphalt coring services as well as environmental assessment and underground fuel storage tank studies and monitor well installations.

This company's growth, existence, and reputation is based upon our capability to perform professional tests within the strict, prescribed guidelines of technical associations, and government standards and regulations. Considerable pride and expertise in procedures and manner of conducting technical tests have been the trademark for CSRA Testing and Engineering Company, Inc.

We employ only experienced, qualified, and dedicated personnel. Our capability to perform testing services for both small and large projects in a successful, timely manner is a result of our organized engineering approach. Our intent is to perform quality tests in strict accordance with established procedures and to document, review, and certify all test results.

Over the past ten years, our small company has professionally performed approximately 75,000 various tests for over 900 different clients. This has given us extensive experience in a wide variety of testing services. We are the only American owned testing firm in the Central Savannah River Area offering soil, concrete, asphalt, and physical testing services.

Augusta, Georgia

Experience

Extensive training and experience in soils, concrete and asphalt construction and test procedures both "on-site" and in the laboratory. Knowledgeable of all applicable ASTM, AASHTO, and Corps of Engineers standards. Responsible for sampling and evaluations of environmental and geotechnical study sites.

Major Categories

Subsurface Exploration, Rock Boring, Monitor Well Installation, and Concrete Coring.

Years Experience

Twenty-four

Training and Certifications

Well Drillers Certification-South Carolina No. 1380
Use of Nuclear Testing Equipment Certification
OSHA Hazardous Waste and Emergency Response
ACI Concrete Field Testing Certification
NICET - Level I, Geotechnical Engineering Technology - Exploration
NICET - Level I, Geotechnical Engineering Technology - Construction
NICET - Level I, Geotechnical Engineering Technology - Generalist
GSWCC Level IA Certification No. 70417

Chris Lowry

Inspector

Education

Aiken High School
Aiken, South Carolina

Experience

Quality Control Inspector/Technician

Extensive training and experience passing written and oral examinations in soils, concrete and asphalt construction and test procedures both "on-site" and in the laboratory. Knowledgeable of applicable ASTM, AASHTO, and Corps of Engineers standards. Special inspections.

Years Experience

Three

Training and Experience

Use of Nuclear Testing Equipment Certification
OSHA Hazardous Waste and Emergency Response
WACEL Soils Level I Technician
ACI Concrete Field Testing Technician-Grade I

Inspector

Education

Augusta Technical College
Augusta, Georgia

Hephzibah High School
Hephzibah, Georgia

Experience

Quality Control Inspector/Technician

Extensive training and experience passing written and oral examinations in soils, concrete and asphalt construction and test procedures both "on-site" and in the laboratory. Knowledgeable of applicable ASTM, AASHTO, and Corps of Engineers standards. Special Inspections.

Years Experience

Fifteen

Training and Experience

Use of Nuclear Testing and Equipment Certification
OSHA Hazardous Waste and Emergency Response
Level IA - Fundamentals of Erosion and Sediment Control
International Code Council - Soils Special Inspector
SCDOT - Asphalt Roadway Technician
ACI Concrete Field Testing Technician-Grade I

Branon Mitchell

Inspector

Education

North Augusta High School
North Augusta, South Carolina

Experience

Quality Control Inspector/Technician

Extensive training and experience in soils, concrete and asphalt construction and test procedures both "on-site" and in the laboratory. Knowledgeable of applicable ASTM, AASHTO, and Corps of Engineers standards. Special inspections.

Years Experience

Three

Training and Experience

Use of Nuclear Testing and Equipment Certification
OSHA Hazardous Waste and Emergency Response
International Code Council Structural Masonry Special Inspector
SC Office of State Facilities Special Inspector

AASHTO Accreditation Program - Certificate of Accreditation

This is to signify that

CSRA Testing & Engineering Company, Inc.

Augusta, Georgia

has demonstrated proficiency for the testing of construction materials
and has met the minimum requirements in AASHTO R18
set forth by the AASHTO Highway Subcommittee on Materials.

The scope of accreditation can be obtained by viewing
the AAP Directories of Accredited Laboratories (www.amrl.net)
or by contacting AMRL.

Executive Director

Chair, AASHTO Highway
Subcommittee on Materials

Envirocon

Excavation Inspection Report

Date: July 28, 2016 to August 8, 2016	
Project Title: SRNS 488-4D Ash Landfill	**Location: Jackson, SC**

Observations of Fill Placement & Compaction Activities – Installation of catch basin #4 and CPP pipe:

- July 28, 2016: Envirocon installs catch basin #4 in NE corner of 488-4D ash landfill.
- Location of catch basin and manhole marked by GEL surveyor. After reaching proper depth, 12 inches of #57 stone base installed and compacted under catch basin. Catch basin placed on stone base and orientation and elevation checked by GEL surveyor.
- August 5 & 6, 2016: The excavation for the CPP trench between CB #4 and Manhole #1 had groundwater infiltration. After discussion with Don Baston (SRNS), the decision was made to install fabric and rock under the CPP to bridge the soft soil.
- Envirocon completes the installation of catch basin #4, manhole #1 connection, and CPP pipe. GEL surveyor marks location of pipe. CPP pipe set and invert elevations checked by surveyor. Initial backfill placed around pipe and compacted with a plate-type tamper.
- Envirocon completes one lift of backfill around CPP pipes to be ready for compaction testing on Monday. Complete grouting of CPP pipes.
- August 8, 2016: Britt Baynham (CSRA Testing) on site to perform compaction testing on the initial backfill around the CPP pipe. Backfill is compacted to a minimum of 95% compaction in the roadway. All compaction tests pass.
- Britt Baynham performs compaction testing on the final backfill over the CPP pipe. Final backfill is compacted with five passes of a smooth drum roller. Final backfill is compacted to a minimum of 95% compaction in the roadway. All compaction tests pass.

Additional Comments:

- None.

Envirocon

Excavation Inspection Report

Date: April 14, 2016 to May 26, 2016	
Project Title: SRNS 488-4D Ash Landfill	**Location: Jackson, SC**

Observations of Fill Placement & Compaction Activities – Installation of catch basin #5 and manhole #2:

- April 14, 2016: Envirocon installs catch basin #5 and manhole #2 in NW corner of 488-4D ash landfill.
- Location of catch basin and manhole marked by GEL surveyor. After reaching proper depth, 12 inches of #57 stone base installed and compacted under catch basin and manhole. Both manhole and catch basin placed on stone base and orientation and elevation checked by GEL surveyor.
- Envirocon determines that the floor elevation of the existing catch basin #1 is higher than the design elevation and did not take into account the thickness of the CPP pipe. After discussion with Don Baston (SRNS), the decision is made to raise the invert of the CPP pipe for CB #5 and MH #2 by 0.25 feet.
- April 15, 2016: Envirocon completes the installation of catch basin #5, manhole #2, and CPP pipe. CPP pipe set and invert elevations checked by surveyor. Initial backfill placed around pipe and compacted with a plate-type tamper.
- Chris Lowry (CSRA Testing) on site to perform compaction testing on the initial backfill around the CPP pipe. Backfill is compacted to a minimum of 95% compaction in the roadway. All compaction tests pass.
- April 16, 2016: Envirocon places one lift of backfill over CPP pipes to be ready for compaction testing on Monday. Complete grouting of CPP pipes.
- April 18, 2016: Chris Lowry on site to perform compaction testing on the final backfill around the CPP pipe. Final backfill is compacted with five passes of a smooth drum roller. Final backfill is compacted to a minimum of 95% compaction in the roadway. All compaction tests pass.
- May 23, 2016: Envirocon determines that the grout around the CPP pipe is leaking in MH #2 and CB #1. Envirocon excavates around the CPP pipe to repair the grout seal.
- May 24, 2016: Envirocon completes the re-grouting of the CPP pipe.
- May 26, 2016: Chris Lowry on site to perform compaction testing on the initial and final backfill around and over the CPP pipe. Initial backfill is compacted with a plate-type tamper. Final backfill is compacted with five passes with a smooth drum roller. Backfill is compacted to a minimum of 95% compaction in the roadway. All compaction tests pass.

Additional Comments:

- None.

Excavation Inspection Report

Date: April 21, 2016 to April 22, 2016	
Project Title: SRNS 488-4D Ash Landfill	**Location: Jackson, SC**

Observations of Fill Placement & Compaction Activities – Installation of catch basin #6 and FES-1 and catch basin #7 and FES-2:

- April 21, 2016: Envirocon installs catch basin #6 in SE corner of 488-4D ash landfill.
- Location of catch basin marked by GEL surveyor. After reaching proper depth, 12 inches of #57 stone base installed and compacted under catch basin. Catch basin placed on stone base and orientation and elevation checked by GEL surveyor.
- Envirocon installs FES-1 CPP pipe. GEL surveyor marks location of pipe. Soil excavated to proper depth. FES-1 pipe set and invert elevations checked by surveyor. Initial backfill placed around pipe and compacted with a plate-type tamper.
- April 22, 2016: Chris Lowry (CSRA Testing) on site to perform compaction testing on the initial and final backfill around FES-1 CPP pipe. The initial backfill is compacted with a plate-type tamper. The final backfill is compacted with 5 passes with a smooth drum roller.
- Backfill is compacted to a minimum of 95% compaction in the roadway and 90% compaction outside of the roadway. All compaction tests pass.
- Envirocon installs catch basin #7 on south side of 488-4D ash landfill.
- Location of catch basin marked by GEL surveyor. After reaching proper depth, 12 inches of #57 stone base installed and compacted under catch basin. Catch basin placed on stone base and orientation and elevation checked by GEL surveyor.
- Envirocon installs FES-2 CPP pipe. GEL surveyor marks location of pipe. Soil excavated to proper depth. FES-2 pipe set and invert elevations checked by surveyor. Initial backfill placed around pipe and compacted with a plate-type tamper.
- Chris Lowry (CSRA Testing) on site to perform compaction testing on the initial and final backfill around FES-2 CPP pipe. The initial backfill is compacted with a plate-type tamper. The final backfill is compacted with 5 passes with a smooth drum roller.
- Backfill is compacted to a minimum of 95% compaction in the roadway and 90% compaction outside of the roadway. All compaction tests pass.

Additional Comments:

- None.

Excavation Inspection Report

Date: June 29, 2016 to July 5, 2016	
Project Title: SRNS 488-4D Ash Landfill	**Location: Jackson, SC**

Observations of Fill Placement & Compaction Activities – Installation of catch basin #8 and FES-3:

- June 29, 2016: Envirocon installs catch basin #8 in SE corner of 488-4D ash landfill.
- Location of catch basin marked by GEL surveyor. After reaching proper depth, 12 inches of #57 stone base installed and compacted under catch basin. Catch basin placed on stone base and orientation and elevation checked by GEL surveyor.
- June 30, 2016: Envirocon installs FES-3 CPP pipe. GEL surveyor marks location of pipe. Soil excavated to proper depth. FES-3 pipe set and invert elevations checked by surveyor. Initial backfill placed around pipe and compacted with a plate-type tamper.
- July 5, 2016: Britt Baynham (CSRA Testing) on site to perform compaction testing on the initial and final backfill around FES-3 CPP pipe. The initial backfill is compacted with a plate-type tamper. The final backfill is compacted with 5 passes with a smooth drum roller.
- Backfill is compacted to a minimum of 95% compaction in the roadway and 90% compaction outside of the roadway. All compaction tests pass.

Additional Comments:

- None.

CONSTRUCTION TESTING/INSPECTION REPORT

CLIENT:	Envirocon, Inc.	ADDRESS:	Missoula, MT
PROJECT:	488-4D Ash Landfill Closure, C-SPP-D-00002	LOCATION:	Savannah River Site Aiken County, SC
SRNS PO#:	196912		
WEATHER:	Sunny and Hot	REPORT NO:	T15-U90

WORK IN PROGRESS:	See General Comments
TEST PERFORMED AND RESULTS:	See General Comments
INSTRUCTIONS RECEIVED:	Technician on site
GENERAL COMMENTS:	As requested by client, technician observed a loaded dump truck proofroll the areas as shown on the attached map. With the exception of to the "noted areas" on the attached map, all other areas appeared to be firm and stable at this time. The noted areas contained saturated material from previous rain events. It was suggested to remove and allow to dry, or replace with a drier, more stable material.

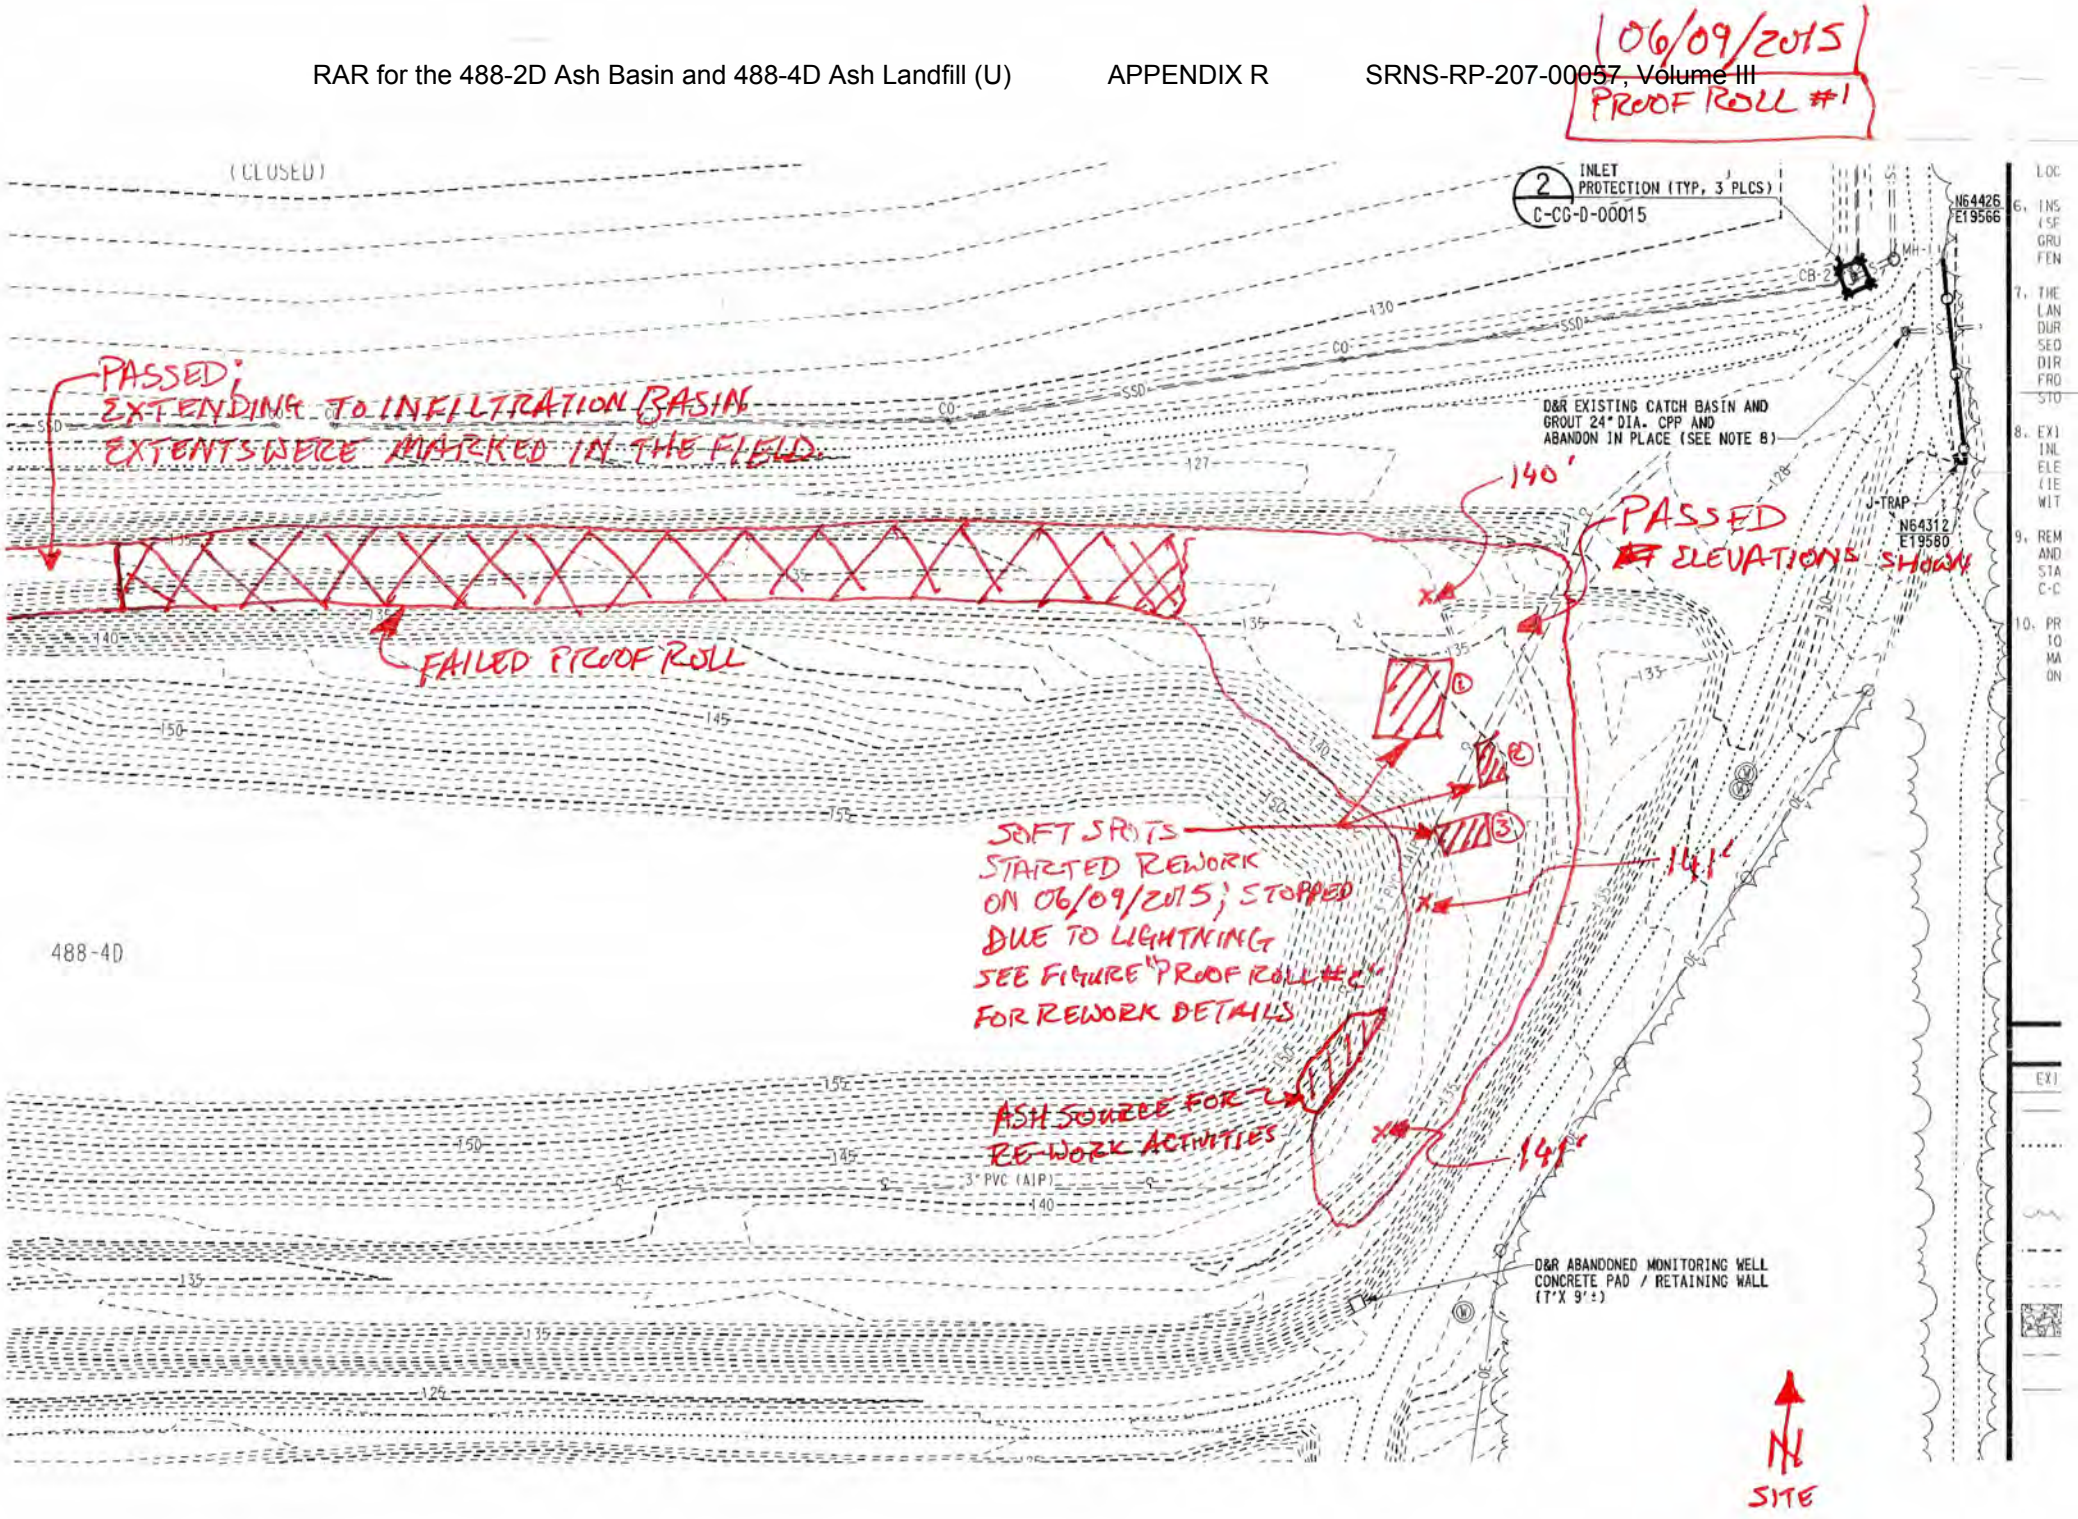
Proof-Roll Inspection Addendum

Date: Monday, June 15th, 2015	
Project Title: SRNS 488-4D Ash Landfill	**Location: Jackson, SC**

Work Performed On-Site:



- As mentioned in CSRA's Construction Testing/Inspection report, dated June 9th, 2015, the "Noted Areas" were reworked as follows:
  - On June 9th, 2015, following the Proof Roll Inspection, the soft spots were excavated to a depth ranging from 18 inches to 24 inches (Sketches of Proof Roll 06/09/2015). Each lift was backfilled with drier ash material in 12 inch loose lifts and compacted with the roller with 5 vibratory passes.
- The inspection of the reworked areas was delayed due to rain on June 9th and June 10th. The areas were allowed to dry out before retesting.
- Due to Envirocon's Field Engineer's absence during proof roll, Site Superintendent Doug Hanson, SRNS STR Terry Schallick, and SRNS Engineer Don Baston witnessed the reworked proof-rolled areas today. After observing a 25 Ton articulating truck pass over each area several times, the noted areas were approved by all parties.

Date:	Time:	Direction of View / Location:

Proof-Roll Inspection Addendum

Date: Monday, July 6th, 2015	
Project Title: SRNS 488-4D Ash Landfill	**Location: Jackson, SC**

Work Performed On-Site:

- Per CSRA's Construction Testing/Inspection report, dated June 24th, 2015, the North Trench area, as shown in the report, was reworked as follows:
  - On June 24th, 2015, following the Proof Roll Inspection, the North Trench area was plowed up with the road grader (CAT G930B) to allow for the ash material to dry out.
  - On June 25th, 2015, the North Trench area was plowed up a second time to allow for mixing of the ash material and continued drying out. At the end of the workday the area was re-compacted with the roller #2 (CV122PDU) with 5 vibratory passes. Then the material was covered with uncompacted ash material to serve as protection over the weekend.
  - On June 29th, 2015, the uncompacted ash material was removed from the North Trench area and the top layer was re-compacted with the roller #2. The area was undisturbed until the Proof Roll Inspection on Tuesday, June 30th, 2015.
- In addition to reworking the North Trench area Envirocon prepared the ash material in the Infiltration Basin in preparation for the next Proof Roll Inspection on Tuesday, June 30th, 2015 (see CSRA Construction Testing/Inspection report dated, June 30th, 2015).

Daily Field Engineer Report

Date: Thursday, June 25th, 2015	
Project Title: SRNS 488-4D Ash Landfill	**Location: Jackson, SC**

Work Performed On-Site: (Detail work performed by Envirocon and Envirocon's subcontractors)

- Outer Boundary Area (West Slope): No progress today.
- 488-2D: Continued excavation and hauling operations today. Ash removal along the north bank was haulted once it reached the center ramp between 488-2D and 488-4D (see Daily Fill Report). Ash removal operations moved to the base at 1350 hours. Hauled 123 truckloads (est. 3,444 cu yds.) of ash material to 488-4D. The dozer #2 (CAT D6) helped to push ash material towards the excavator.
- 488-4D: Stockpiled ash material from 488-2D on top of 488-4D. Spread out the stockpiled ash material on the north and south face to help dry out the ash material before placement and compaction. Continued to rework the ash material in the North Trench area (see Daily Fill Report).
  - Used the Road Grader (CAT G930B) to plow up the ash material.
  - The ash material was re-compacted with the roller #2 (CV112PDU) and covered with approximately 18 inches of uncompacted ash material for protection over the weekend.
  - Removed ash material from the North Bank area to the top of 488-4D to allow for drying.
  - Completed construction of a new ramp between 488-4D and 488-2D located at the south of the infiltration basin (see Daily Fill Report).

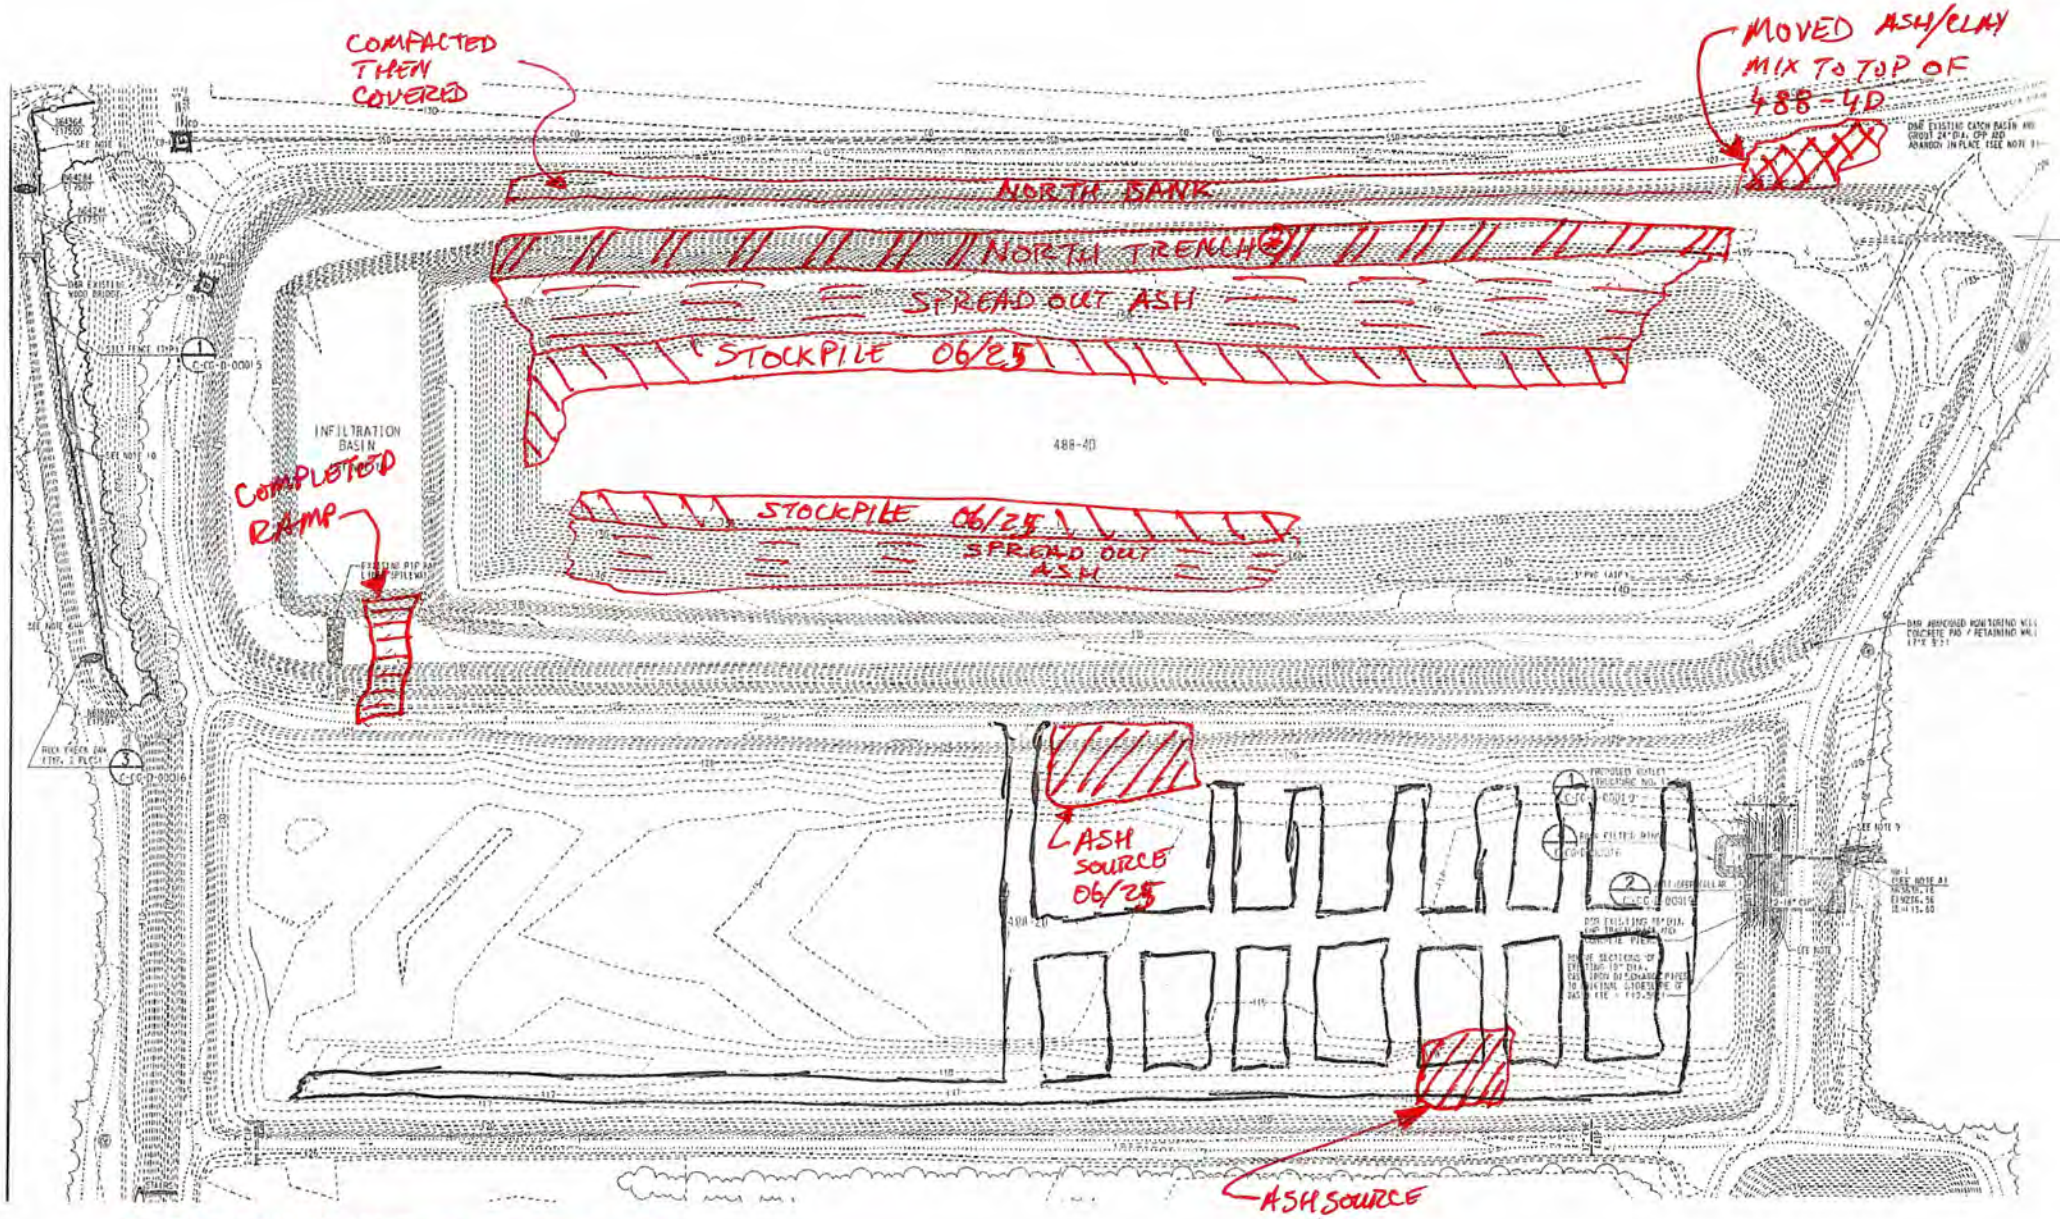
Date: Thursday, June 25th, 2015	
Project Title: SRNS 488-4D Ash Landfill	**Location: Jackson, SC**

Area of Backfill:

Location	Lift #	Elevation	Lift Thickness	Estimated Ash Volume
488-4D North Trench	N/A	140' to 142' Uncompacted Ash Covering	est. 18 in.	est. 750 cu yds.
488-4D Side Slopes	N/A	North & South faces of the existing stockpile	est. 12 in.	est. 1,200 cu yds
Est. Volume of Ash Material	488-2D 488-4D	Delivered & Stockpiled Grading **Net**		est. 3,444 cu yds. est. 1,950 cu yds **est. 5,394 cu yds**
Equipment Used		Compaction: Spreading: Delivering:		XCMG CV122PDU CAT D6 Volvo A40 (3)

Observations of Backfill & Compaction Operations:

- Hauled 123 truckloads of ash material from 488-2D to the north top of slope of 488-4D.
- The ash material was stockpiled on the north edge of the top of slope for the existing ash stockpile. The stockpiled ash material was spread out over the north and south face to help dry out the ash material.
- The North Trench area was plowed up for a second time with the road grader (CAT G930B) to allow for the ash material to dry out. After allowing for drying time then the ash material was re-compacted with the roller #2 (CV112PDU) with 5 vibratory passes.
- Mr. Crace (FE) inspected the re-compacted ash material in the North Trench area and determined that it was sufficiently compacted to pass the Proof Roll Inspection. Mr. Crace approved for the compacted ash material to be covered with loose ash material for the weekend.
- A new ramp was completed on the south end of the Infiltration Basin (see Daily Activity figure) for future hauling operations in/out of 488-2D.
- The saturated mixture of ash and clay material within the North Bank area



was collected by the front end loader (Komat'su 450) and stockpiled on top of 488-4D (see Daily Activity Drawing).

- No work was performed in the Infiltration Basin. Envirocon plans to evaluate the condtion of the ash material on Monday to verify the level of effort required to make the Infiltration Basin ready for a Proof Roll Inspection.
- Envirocon tentatively plans to have another Proof Roll Inspection on Tuesday, June 30th, 2015, following the Weekly Status Meeting.

Daily Field Engineer Report

Date: Monday, June 29th, 2015	
Project Title: SRNS 488-4D Ash Landfill	**Location: Jackson, SC**

Work Performed On-Site: (Detail work performed by Envirocon and Envirocon's subcontractors)

- Outer Boundary Area (West Slope): Repaired undermining of silt fence.
- 488-2D: Continued excavation and hauling operations today. Hauled 113 truckloads (est. 3,164 bank cu yds.) of ash material to 488-4D. Excavation continued westward on the floor of 488-2D (see attached Daily Fill Report). The dozer #2 (CAT D6) pushed the ash material towards the excavator (Komat'su 450) to assist with loading operations.
- 488-4D: Stockpiled ash material from 488-2D on top of 488-4D. Spread out the stockpiled ash material on the north and south face of the existing stockpile (see Daily Fill Report). Prepared the North Trench area and the Infiltration Basin area for the Proof Roll Inspection tomorrow.
  - Removed ash covering from the North Trench area and moved the ash to the North Bank area for compaction.
  - Mr. Crace (FE) and Ms. Schallick (STR) performed a preliminary proof roll inspection with an empty water truck, weighing 25 tons. No major problem spots were located and determined both the Infiltration Basin and the North Trench areas are ready for the Proof Roll Inspection.
  - Stockpiled saturated ash material from the North Bank area on top of 488-4D's existing ash stockpile.

Tests / Inspections Conducted Today:

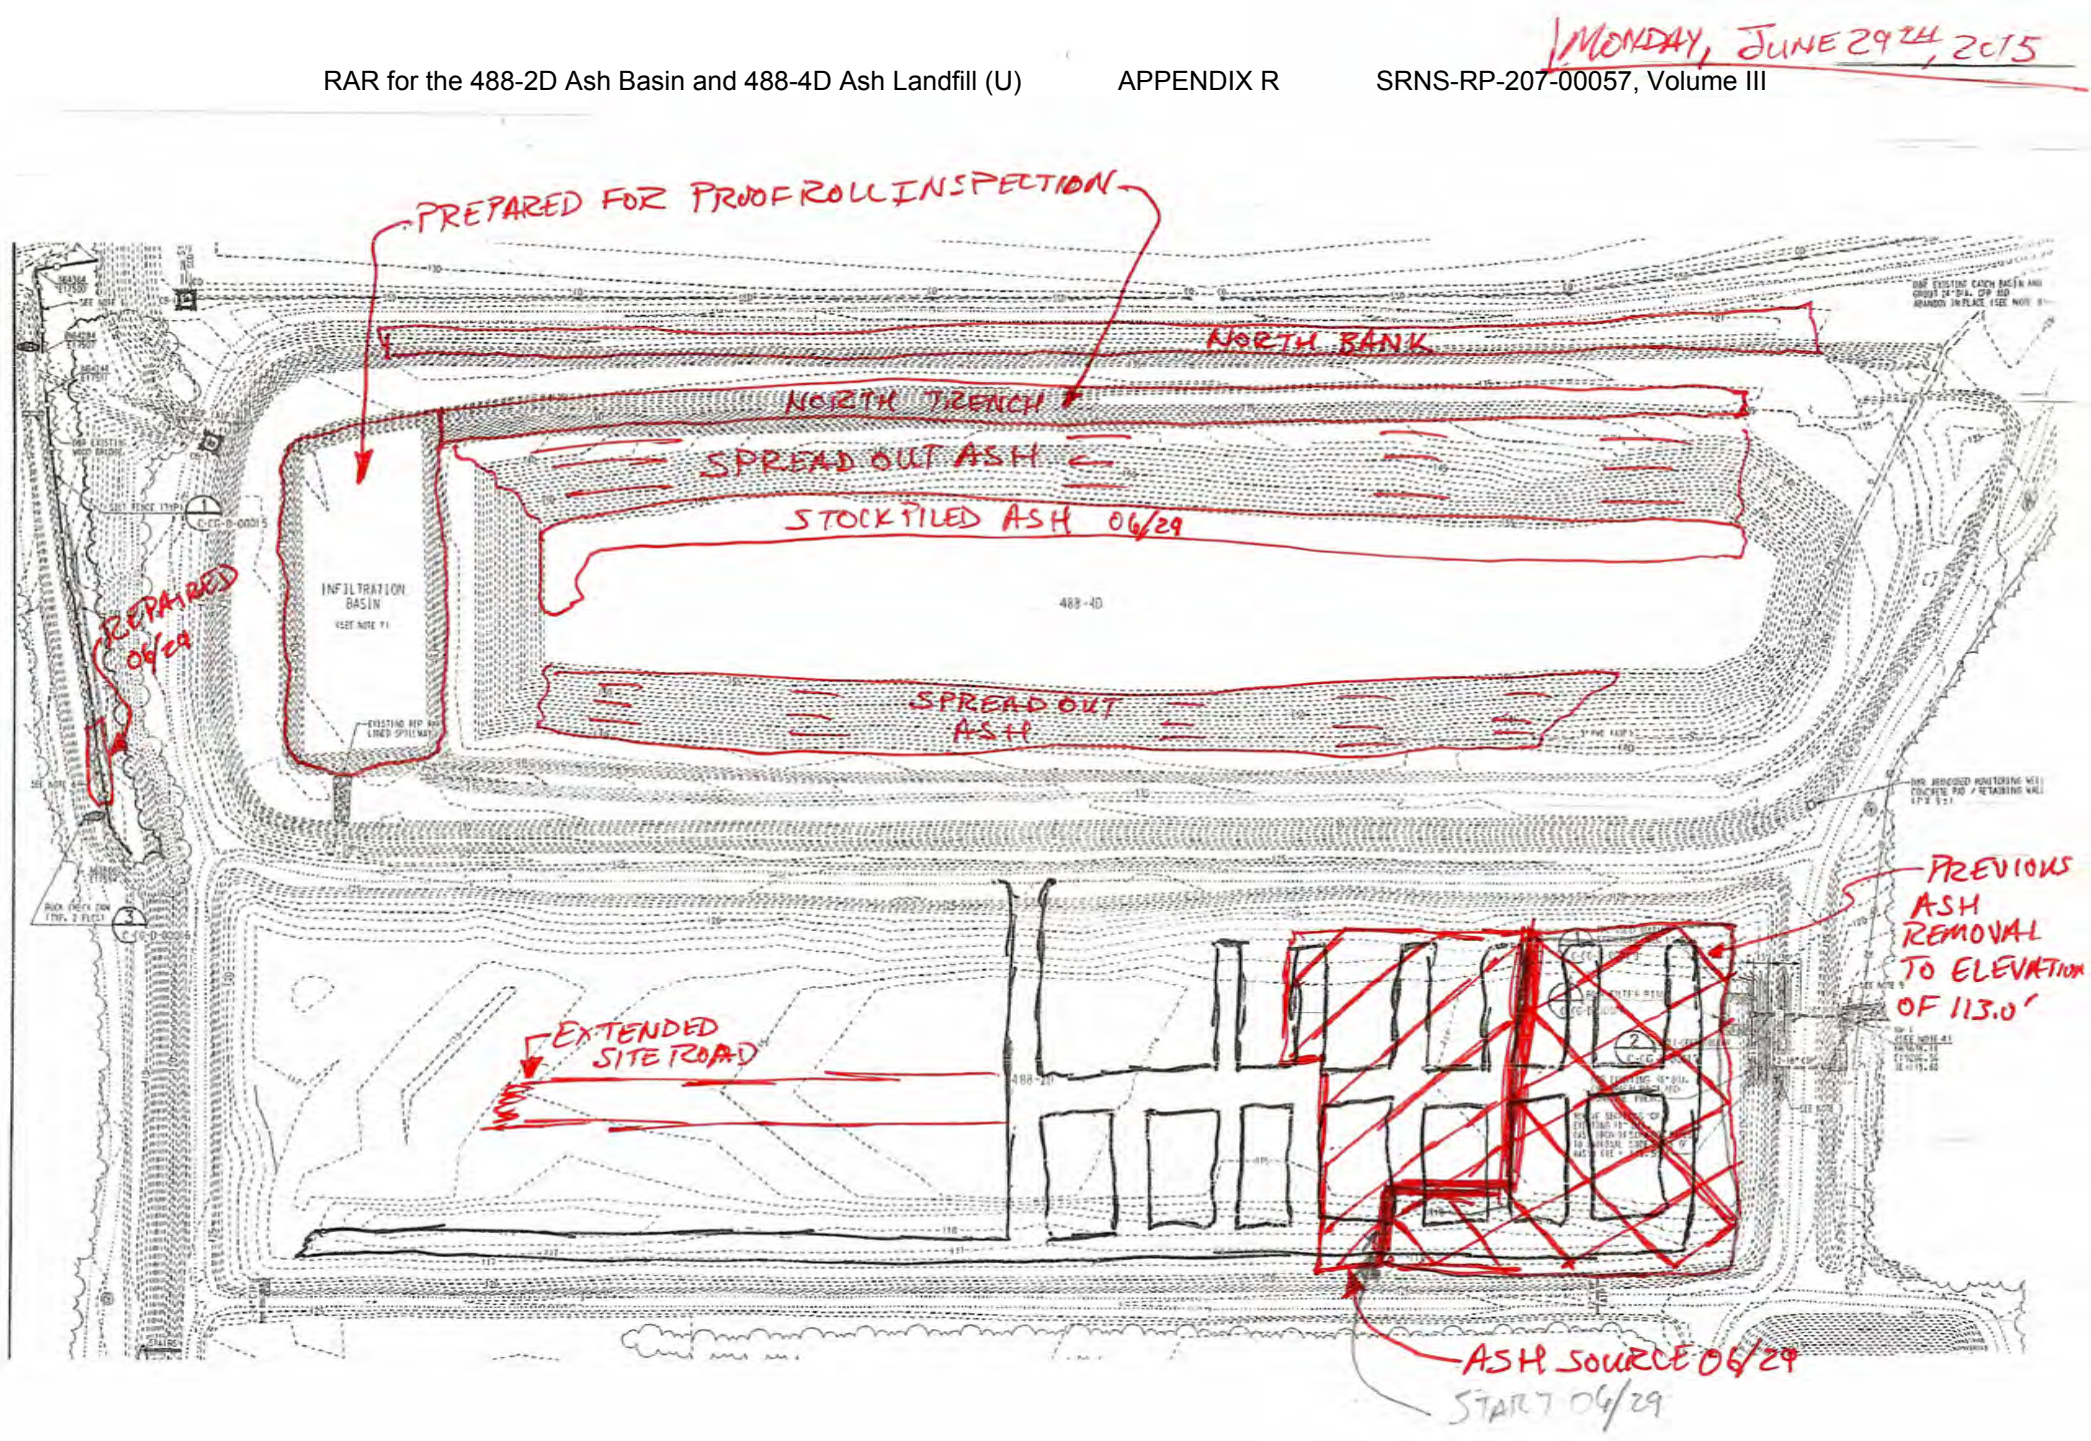
Date: Monday, June 29th, 2015	
Project Title: SRNS 488-4D Ash Landfill	**Location: Jackson, SC**

Area of Backfill:

Location	Lift #	Elevation	Lift Thickness	Estimated Ash Volume
488-4D North Trench		133 ft to 141 ft to 138 ft *Prepared for Proof Roll*	N/A	est. 300 cu yds
488-4D Infiltration Basin		130.5 ft to 129.5 ft *Prepared for Proof Roll*	N/A	est. 52 cu yds
488-4D North Bank	3	128 ft to 125 ft	6 inches	est. 100 cu yds
Est. Volume of Ash Material	488-2D 488-4D	Delivered & Stockpiled Grading **Net**		est. 3,248 cu yds. est. 452 cu yds **est. 3,700 cu yds**
Equipment Used		Compaction: Spreading: Delivering:	XCMG CV122PDU CAT D6 Volvo A40 (3)	



Observations of Backfill & Compaction Operations:

- Hauled 116 truckloads of ash material from 488-2D to the north top of slope of 488-4D.
  - The stockpiled ash material was spread out over both the north and south faces of the existing ash stockpile.
- The Infiltration Basin and the North Trench areas were prepared for the Proof Roll Inspection scheduled for Tuesday, June 30th, 2015. The areas had the top 3 inches scraped off and re-compacted with the roller with a minimum of 5 vibratory passes.
  - The areas were then inspected by Mr. Crace (FE) and Ms. Schallick (STR) with the use of an empty water truck to check for any soft spots. No major issues were found with the preliminary proof roll inspection. The official proof roll inspection will be performed tomorrow, June 30th, 2015.

- The cover ash that was scraped off the top of the North Trench was pushed over to the North Bank area.
- The North Bank area had low spots filled in with ash material from the North Trench & 488-2D. The entire area was compacted with 5 vibratory passes from the roller #2. The saturated ash material was consolidated on the east end and removed, by the front-end loader (Komat'su 450) to the stockpile area in 488-4D (est. 50 cu yds).

Proof-Roll Inspection Addendum

Date: Monday, August 17th, 2015	
Project Title: SRNS 488-4D Ash Landfill	**Location: Jackson, SC**

Repair Work Performed:

- Per CSRA's Construction Testing/Inspection report, dated August 12th, 2015, the following repairs were made in the Infiltration Basin:
  - On August 12th, 2015, following the Proof Roll Inspection, the soft spot (50' x 25') was excavated down 2'. Used dozer #3 (CAT D6) to excavate and spread out the ash fill material. Mr. Crace (FE) observed the backfilling of the soft spot. The ash fill material was backfilled in 3 lifts. East lift was compacted with 6 vibratory passes from the sheeps-foot roller (CV122PD). The repair was completed by 1355 hours and the area was not touched for the rest of the day.
  - On the morning of August 13th, 2015, the soft spot was rechecked with an empty water truck under the observation of Mr. Baston (SRNS), per his request. The soft spot was found to be pumping, unlike earlier in the morning. The soft spot was excavated a second time and allowed to dry out for about 3 hours. At 1330 hours the soft spot was backfilled with ash fill material from the adjacent area under Mr. Crace's supervision. Each lift was compacted with 6 vibratory passes from the sheeps-foot roller.
  - On August 14th, 2015, the repair to the soft spot was rechecked with the empty water truck with Mr. Crace and Ms. Schallick (STR) observing. The compacted fill was still pumping. The soft spot was ripped open to allow the fill material to dry. It was compacted with the smooth-drum roller and rechecked with an empty water truck. The compacted fill material was still too soft to pass and decided to leave the area alone and recheck on Monday, August 17th, 2015.
  - On Monday, August 17th, 2015, the soft spot was checked. A proof roll recheck with the empty water truck was performed. The soft spot passed the Proof Roll.
- For the North Slope the compacted fill was approved up to 14' from the toe of the slope. Later, Mr. Crace (FE) verified the design slope for the ash fill material and determined the design slope would fall within the approved 14' width. Therefore, no additional work is required in the North Slope area (elevation 132').

CONSTRUCTION TESTING/INSPECTION REPORT

CLIENT:	Envirocon, Inc.	ADDRESS:	Missoula, MT
PROJECT:	488-4D Ash Landfill Closure, C-SPP-D-00002	LOCATION:	Savannah River Site Aiken County, SC
SRNS PO#:	196912		
WEATHER:	Sunny and Hot	REPORT NO:	T15-HH55PR

WORK IN PROGRESS:	See General Comments
TEST PERFORMED AND RESULTS:	Proofroll inspection
INSTRUCTIONS RECEIVED:	Technician on site
GENERAL COMMENTS:	As requested by client, technician observed an empty water truck proofroll area and elevation shown on the attached map. The area appeared unstable and pumping at this time. It was suggested to allow this area to dry. If time is not available for drying out, removal and replacement or stabilization would be necessary.

Proof-Roll Inspection Addendum

Date: Wednesday, September 2nd, 2015	
Project Title: SRNS 488-4D Ash Landfill	**Location: Jackson, SC**

Repair Work Performed:

- Per CSRA's Construction Testing/Inspection report, dated August 26th, 2015, the following repairs were made in the East Area:
  - On August 27th, 2015, the road grader (CAT G930B) used the grippers to plow up the identified soft spots in the East Area. The material was allowed to dry out for the morning. At 1300 hours, Mr. Crace (FE) inspected the compacted soft spots with the probe rod and an empty water truck. Determined the compacted fill material was still pumping and would fail the Proof Roll. Did not perform any additional repair work and allowed the compacted fill to firm up over the weekend.
  - On Monday, August 31st, 2015, Mr. Crace and Ms. Schallick (STR) inspected the soft spot with an empty water truck and found the soft spots were not ready. The soft spots were left alone and allowed to dry out for the day. At 1530 hours, Mr. Crace inspected the soft spots, again, with the probe rod and determined the soft spots were ready for a Proof Roll in the morning.
  - On Tuesday, September 1st, 2015, Mr. Crace and Ms. Schallick observed the soft spots during a preliminary proof roll with the empty water truck. The compacted fill material was still pumping. At the Weekly Status Meeting Mr. Crace discussed the issue with Mr. Baston (SRNS). Following the meeting another Proof Roll was performed with Mr. Baston observing. Afterwards it was agreed to excavate at least 1' depth for the areas in the site road and along the east edge of the lift. After the excavated locations were backfilled and compacted with drier ash fill material then Envirocon can proceed with the next 4' of fill.
  - On Wednesday, September 2nd, 2015, the marked soft spots were excavated 1' under the supervision of Mr. Crace with Ms. Schallick observing. The excavated spoils were pushed to the east. The drier ash fill was pushed from the east slope of the 488-4D Impoundment.
- Attempted to perform the Proof Roll on the Infiltration Basin, but it was called off by Mr. Crace (FE) after the first couple of passes. It was determined the whole area was too soft and would need time to dry out.

Proof-Roll Inspection Addendum

Repair Work Performed:

- Per CSRA's Construction Testing/Inspection report, dated October 26th, 2015, the following repairs were made in the Infiltration Basin:
- No site work was performed on Tuesday, October 27th, and Wednesday, October 28th, due to 0.48" of rain through Wednesday night.
- On Thursday, October 29th, excavated 466 BCY of saturated compacted ash from both soft spots delineated from the proof roll inspection on Monday, October 26th. Backfilled with 466 BCY of ash fill material from the east end of 488-4D Impoundment.
- On Friday, October 30th, excavated 377 BCY of saturated compacted ash from the soft spots backfilled yesterday (Oct. 29th). The excavations were backfilled with wet ash fill in case there was no site work today due to the Safety Time-Out. The 377 BCY of saturated ash fill was loaded onto an articulating truck (Volvo A30) and delivered to the southeast portion of the top of the Impoundment.
- No additional work was performed from Monday, November 2nd, until Wednesday, November 11th, due to the saturated site conditions (4.80" of rain). Starting on Thursday, November 12th, the area was plowed up to dry out.
- On Monday, November 16th, re-compacted the ash fill material in the Infiltration Basin with 4 vibratory passes with the sheeps-foot roller (CV122PD) and 2 vibratory passes from the smooth-drum roller (CV122PD). Mr. Crace (FE) inspected the compacted fill with the probe rod and determined the fill adjacent to the Impoundment (25' x 135') was still too wet and pumping under the weight of the roller. The ash fill was excavated down 1.5' and replaced with 191 BCY of drier ash from the top of the Impoundment. The repair was compacted with 4 vibratory passes with the sheeps-foot roller (CV122PD) and 2 vibratory passes from the smooth-drum roller (CV122PD). Tentatively, scheduled a Proof Roll Inspection for tomorrow afternoon following the Weekly Status Meeting.
- On Tuesday, November 17th, Mr. Crace performed a proof roll check with the empty water truck. The fill failed the proof roll check. Mr. Crace (FE) instructed the entire north half of the Infiltration Basin to be plowed up to allow for drying. The tractor (NH 8770) pulled the disc plow across the north half of the Infiltration Basin
- On Wednesday, November 18th, plowed up the ash fill with the tractor (MH 8770) to allow for the compacted ash fill material to dry out. At the end of the day the area was sealed up with 2 static passes with the smooth-drum roller (CV122PD).
- There was no site work on Thursday, November 19th, and Friday, November 20th, due to 1.51" of rainfall over the 2 days.
- On Monday, November 23rd, excavated 126 BCY of saturated ash fill from the SE corner of the Infiltration Basin and backfilled with 126 BCY of common fill from the Borrow Pit and compacted with 5 vibratory passes from the smooth-drum roller (CV122PD).
- On Tuesday, November 24th, excavated 605 BCY of saturated ash fill from the north-half (est. 0.35 acres) of the Infiltration Basin. Due to all of the rains, Mr. Crace decided to excavate the entire north half of the Infiltration Basin. Backfilled the repair spot with 335 BCY of common fill from the Borrow Pit (only half the repair was backfilled today). The backfill was not compacted today. The common fill was spread out by the dozer #2 (CAT D6).
- On Wednesday, November 25th, completed the backfill of the repair spot with 270 BCY of common fill from the Borrow Pit. The common fill was spread out by the dozer #2 (CAT D6) and compacted with the smooth-drum roller (CV122PD).

Envirocon

Proof-Roll Inspection Addendum

- On Monday, November 30th, returned to site work following the Thanksgiving holiday. Compacted all repair spots with 4 vibratory passes from the sheeps-foot roller and 2 vibratory passes from the smooth-drum roller. Mr. Crace (FE) and Ms. Schallick (STR) observed the empty water truck perform a proof roll check of the compacted fill (Lift #17) and determined the fill in the north repair spot failed due to high moisture. Mr. Crace instructed the tractor (NH 8770) to plow up the north repair of the Infiltration Basin with the disc plow to allow for the fill to dry out in preparation for a potential proof roll inspection tomorrow.
- On Tuesday, December 1st, performed a proof roll inspection today, after the area was recompacted with the smooth-drum roller (CV122PD). The area passed with a soft spot in the center (30' x 30'). The soft spot was repaired by excavating down 18" bgs and backfilling with dry ash from the top of the Impoundment. The 60 BCY of ash was placed in two lifts and compacted with the sheeps-foot roller (CV122PD; 4 vibratory passes) and smooth-drum roller (CV122PD; 2 vibratory passes). Following the completion of the repair the Infiltration Basin is approved to receive fill up to elevation 145'.

Proof Roll Inspection Date: February 18th, 2016

Repair Work Performed:

- Per CSRA's Construction Testing/Inspection report, dated February 18th, 2016, the following soft spots were identified:
  - The eastern edge of the Infiltration Basin. (completed February 29th, 2016)

    Estimated area ➔ 0.12 acres (20' width x 250' length)
  - SW corner of the Infiltration Basin. (completed February 26th, 2016)

    Estimated area ➔ 0.25 acres
- Thursday, February 18th, 2016: Started repairs immediately following the end of the Proof Roll inspection. Due to the geotextile being located within 12" of the surface the teeth on the excavator's (CAT 329) bucket was used to plow up the ash fill to allow for it to dry out (see Photos, page 1). The dozer (CAT D6) plowed up the ash fill in the east repair spot (along the east edge). The ash fill was allowed to dry out overnight.
- Friday, February 19th, 2016, and Saturday, February 20th, 2016: With forecasted rains starting Monday (Feb. 22nd) through Wed. (Feb 24th) the area was sealed up and covered with plastic sheeting, in order to help protect the remainder of the compacted ash fill (see Photos, page 2 top). Once the rains pass then the plastic cover will be removed and the repairs will be completed.
- Thursday, February 25th, 2016: With the rains completed and the forecast for clear and sunny conditions the plastic cover was removed from the Infiltration Basin and the compacted fill was allowed to dry out for the day.
- Friday, February 26th, 2016: Excavated 275 BCY of ash from the east end of the basin (see Photos, page 2 bottom). Excavated between 1' to 2.5' bgs to remove the unsuitable ash fill material and stockpiled on top of the Impoundment. The excavation remained open for the rest of the weekend in order to let the area dry out before placing dry ash fill material.
  - Proof Roll Verification – SW Corner: Mr. Crace (FE) observed the smooth-drum roller compacting the SW corner repair spot and determined the area was ready for verification Proof Roll. Ms. Schallick observed an empty water truck perform a Proof Roll of the SW corner and accepted the repair as complete.
- Monday, February 29th, 2016: The eastern portion was backfilled with 12" of fill and compacted with 5 vibratory passes from the smooth-drum roller. Mr. Crace (FE) observed the compaction and determined the fill needed to dry out before testing it with the empty water truck. The Proof Roll Verification was delayed until the end of the workday.
  - Proof Roll Verification – East Edge: The proof roll verification was observed by Ms. Schallick (STR) and Mr. Baston (SRNS). The repair was determined to be completed with the completion of the following repair; the center area is to be plowed up to dry out overnight and then recompacted in the morning. The excavator (CAT 329), immediately following the verification inspection, the area was plowed up.

Proof Roll Inspection Addendum

Observations of Proof Roll Activities:

- The top of 488-4D Landfill was backfilled to grade and compacted with 5 vibratory passes from the smooth-drum roller (CV122PD).
- On April 5, 2016, an empty water truck was used to proof roll the northern third of the top surface of the landfill.
- Chris Lowry (CSRA), Don Baston (SRNS), Terry Schallick (SRNS), Tripp Winfree, and Scott Ribes were present.
- All areas appeared to be firm and stable with the exception of five areas as noted on the attached drawing.
- The five areas were excavated approximately 1 foot below grade, allowed to dry, then dry ash was backfilled and compacted with 5 vibratory passes from the smooth-drum roller.
- On April 6, 2016 the water truck was again used to proof roll the repaired areas. The truck was observed by Terry Schallick and Scott Ribes.
- All areas appeared to be firm and stable after the repairs.

CONSTRUCTION TESTING/INSPECTION REPORT

CLIENT:	Envirocon, Inc.	ADDRESS:	Missoula, MT
PROJECT:	488-4D Ash Landfill Closure, C-SPP-D-00002	LOCATION:	Savannah River Site Aiken County, SC
SRNS PO#:	196912		
WEATHER:	Sunny and Mild	REPORT NO:	T16-P39

WORK IN PROGRESS:	See General Comments
TEST PERFORMED AND RESULTS:	Proofroll inspection
INSTRUCTIONS RECEIVED:	Technician on site
GENERAL COMMENTS:	As requested by client, technician observed an empty water truck proofroll the area at elevation as shown on the attached map. With the exception of the noted areas on the attached map, all other areas appeared to be firm and stable at this time. The noted areas appeared to be unstable and pumping was noted in these areas as well. It was suggested to allow areas to dry. If time is not available for drying out, removal and replacement, or stabilization, may be necessary.

TOTAL TIME:	4.0 hours

Proof Roll Inspection Addendum

Observations of Proof Roll Activities:

- The top of 488-4D Landfill was backfilled to grade and compacted with 5 vibratory passes from the smooth-drum roller (CV122PD).
- On April 14, 2016, an empty water truck was used to proof roll the western half of the top surface of the landfill.
- Chris Lowry (CSRA), Don Baston (SRNS), Terry Schallick (SRNS), and Tripp Winfree were present.
- All areas appeared to be firm and stable. No exceptions were noted.

Proof Roll Inspection Addendum

Observations of Proof Roll Activities:

- The top of 488-4D Landfill was backfilled to grade and compacted with 5 vibratory passes from the smooth-drum roller (CV122PD).
- On April 20, 2016, an empty water truck was used to proof roll the eastern half of the top surface of the landfill.
- Chris Lowry (CSRA), Derek Evans (SRNS), Terry Schallick (SRNS), Tripp Winfree, Gerald McKee and Scott Ribes were present.
- All areas appeared to be firm and stable with the exception of three areas as noted on the attached drawing.
- The three areas were excavated approximately 1 foot below grade, allowed to dry, then dry ash was backfilled and compacted with 5 vibratory passes from the smooth-drum roller.
- On April 21, 2016 the water truck was again used to proof roll the repaired areas. The truck was observed by Terry Schallick and Scott Ribes.
- All areas appeared to be firm and stable after the repairs.

VERIFICATION OF SUBGRADE SURFACE ACCEPTANCE

PROJECT NAME: 488-4D Coal Ash Landfill Closure
PROJECT NUMBER: 196912/1495401

LOCATION: Northwest Corner of 4D GCL Panels CZ77 to CZ93

AREA ACCEPTED: Area A-7

DATE OF AREA SURVEY: June 13, 2016

AUTHORIZED REPRESENTATIVE (ENVIROCON): Tripp Winfree

FIELD ENGINEER (ENVIROCON): Raymond Scott Ribes

The undersigned representatives verify that the subgrade surface, which was surveyed and found to be acceptable for installation of the geomembrane on the above date, has not been modified or changed since the initial acceptance and survey. The subgrade surface and the survey for the area accepted have both been approved and the area accepted is now ready for installation of the geomembrane.

Rev 5-26-09

VERIFICATION OF SUBGRADE SURFACE ACCEPTANCE

PROJECT NAME: 488-4D Coal Ash Landfill Closure
PROJECT NUMBER: 196912/1495401

LOCATION: Southeast Corner of 4D GCL Panels C662 to C690

AREA ACCEPTED: Area A-19 and Area A-20

DATE OF AREA SURVEY: July 25 and 26, 2016

AUTHORIZED REPRESENTATIVE (ENVIROCON): Tripp Wintree

FIELD ENGINEER (ENVIROCON): Raymond Scott Ribes

The undersigned representatives verify that the subgrade surface, which was surveyed and found to be acceptable for installation of the geomembrane on the above date, has not been modified or changed since the initial acceptance and survey. The subgrade surface and the survey for the area accepted have both been approved and the area accepted is now ready for installation of the geomembrane.

Repair Report

Project Name: Savannah River Site - Ash Basin Closure
Job # : 14-08-1356
Superintendent: Ali Malimar
Material Type: GCL - AGRU NN66
Primary [ ] **Pond** [ ]
Job Description: SRS Ash Basin Closure
Secondary [ ] **Cell** [ ]
Reported by : Lyssa Tran
Cap [X]
Other:

N/A - This is a generic form, utilized for documenting typical liner repairs. As such, the columns below are not applicable due to the type of GCL repairs performed.

Damage Codes

CR --Crease	FS --Failed Seam	MatD --Material Defect	LL --Lost Lap	CF --Custom Fit
DS --Destruct Sample	WR --Wrinkle	WS --Welder Restart	MD --Mechanical Damage	PB --Pipe Boot
SI --Subgrade Irregularity	AV --Airvent	RW --Roller Wrinkle	DO --Damage By Others	BO --Burn Out
SJ --Seam Joint	AO --Add On	CS --Concrete Structure		AT -Air Test

SF Patch Material	Test Type	Abbrv.	Repair Types
679.5	Vacuum	*S=South	C--Cap Strip
	Air Pressure	*N=North	P--Patch
LF Welded	Spark	*W=West	B--Extrusion Bead
599.00	Air Lance	*E=East	

Repair Number	Damage Code	Seam Number	Panel Number	Location	Repair Type	Patch (Feet)	Bead (Inches)	Date	Operator Name	Machine Number	Test Type	Test Results	Date Complete

Repair Report

Project Name Savannah River Site - Ash Basin Closure
Job # : 14-08-1356
Superintendent: Ali Malimar
Material Type: GDL - AGRU 300-2-6
Primary [ ] **Pond** [ ]
Job Description: SRS Ash Basin Closure
Secondary [ ] **Cell** [ ]
Reported by : Lyssa Tran
Cap [X]
Other:

N/A - This is a generic form, utilized for documenting typical liner repairs. As such, the columns below are not applicable due to the type of GDL repairs performed.

APPENDIX S4

20-Inch Compaction Report

This page intentionally left blank.

csra TESTING AND ENGINEERING CO., INC.

1005 Emmett St., Suite A
Augusta, Georgia 30904
(706) 733-6960
Fax (706) 737-0629

Report No.:	T16-V78		
Date Issued:	June 7, 2016		
Date & Time of Test:	May 17, 2016 (PM)		
Client:	Envirocon, Inc.	**Address:**	Missoula, Montana
Project Title:	488-4D Ash Landfill Closure	**Location:**	Savannah River Site, Aiken Co., SC
Project No.:	C-SPP-D-00002	**SRNS PO#:**	196912
Weather:	Sunny and Mild	**Activity:**	**Compaction**

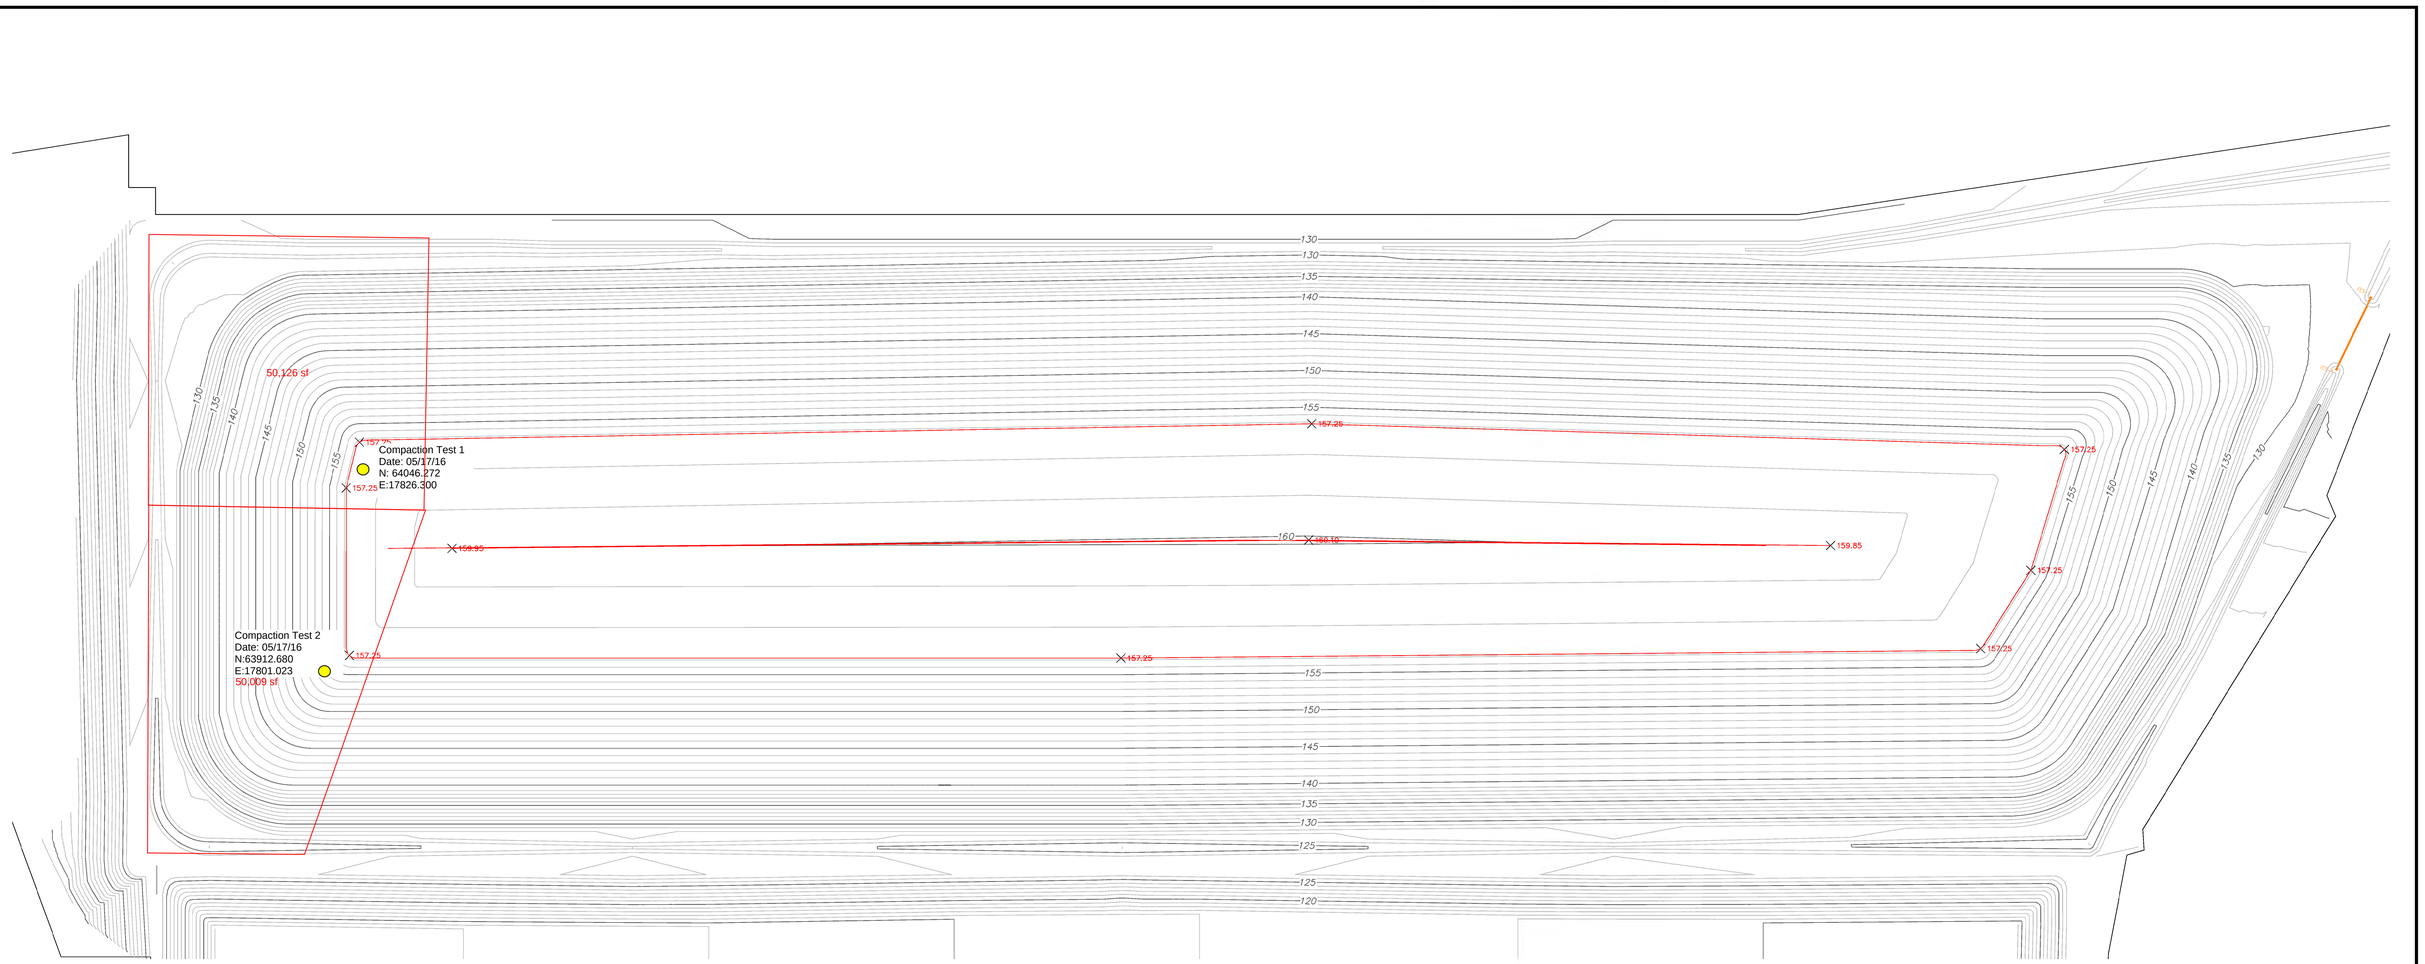
FIELD DENSITY AND MOISTURE CONTENT

Test Method ASTM D-6938

Soil Description: Reddish-Brown Sandy Clay

Proctor Density-Optimum Moisture: 122.5 pcf / 7.5% (mod.)

Test No.	1	2						
Course Level	Please see map							
Area to Be	Please see map							
Dry Density In-Place	120.4	119.8						
% Proctor Density	98.3	97.8						
Moisture Content	7.8	8.0						
% Compaction Required	95.0	95.0						
Conformance	✓	✓						
Non Conformance								
Sand Cone								



Locations: Please see attached map.

Serial No. of Troxler: 38248

Chris Lowey, Technician

James M. Pope, P.E., Reviewer

Member of American Society for Testing and Materials
Accredited by AASHTO Accreditation Program (AAP)

LEGEND:
- Rev 2 Lowered Finish Grade Contour Major
- Rev 2 Lowered Finish Grade Contour Minor

NOTES:
1) This is the lowered cap finish grade. The lowering maintained the 3% slopes previously designed. The new hinge elevation between the 6:1 side slope and the 3% top slope is located at elevation 157.25 along the 6:1 side slope. This hinge location was previously at elevation 160, and 2.75 feet of lowering was needed to accommodate the volume reduction. A uniform lowering does not maintain the proper slopes, because the size of the footprint increased. Therefore the center top crest line was also adjusted in elevation, by lowering these points 2.25 feet from the Rev 1 elevations, and the 3% slopes were then achieved.
2) The ash capacity was reduced by 18,768 BCY by lowering the finish grade to these grades.
3) The revised grade breaks are shown in red along with the revised grade break elevations.

Supplier Document Status

- ☐ 1.Work May Proceed
- ☐ 2.Submit Final Document - Work may proceed
- ☐ 3.Revise and Resubmit - Work may proceed subject to Resolution of Comments
- ☐ 4.Revise and Resubmit. Work may not Proceed.
- ☒ 5.Permission to proceed is not required.

Permission to proceed does not constitute acceptance or approval of design details, calculations, test methods, analysis or materials developed or selected by the supplier, and does not relieve supplier from full compliance with contractual obligations or release of any 'holds' placed on the contract.

Rev 2 Lowered Finish Grade Contour Major

Rev 2 Lowered Finish Grade Contour Minor

NOTES:

1) This is the lowered cap finish grade. The lowering maintained the 3% slopes previously designed. The new hinge elevation between the 6:1 side slope and the 3% top slope is located at elevation 157.25 along the 6:1 side slope. This hinge location was previously at elevation 160, and 2.75 feet of lowering was needed to accommodate the volume reduction. A uniform lowering does not maintain the proper slopes, because the size of the footprint increased. Therefore the center top crest line was also adjusted in elevation, by lowering these points 2.25 feet from the Rev 1 elevations, and the 3% slopes were then achieved.
2) The ash capacity was reduced by 18,768 BCY by lowering the finish grade to these grades.
3) The revised grade breaks are shown in red along with the revised grade break elevations.

APPENDIX S5

Cover Thickness Verification Data

This page intentionally left blank.

Corrections for Slope Surface Thickness Vs. As-Built Survey Data

$$\text{Tan}(\alpha) = (H/V)$$
$$\alpha = \text{ArcTan}(H/V)$$
$$\text{Sin}(\alpha) = (T/M)$$
$$M = T/(\text{Sin}(\alpha))$$
$$M = T/\{\text{Sin}[\text{ArcTan}(H/V)]\}$$

NOTES:

1) H and V are the supplied Horizontal : Vertical values for the slope (e.g. a 2:1 has a H value of 2 and V value of 1).

RE: Savannah River Site (SRS)/FFA
D-Area Ash Landfill (488-4D)
SC1 890 008 989
Barnwell County

Request for the approval for the abandonment of groundwater monitoring wells in support of the D-Area Ash Landfill (488-4D) removal action activities (ER-HGPP-2014-00021), SRNS-J2000-2014-00357, dated July 23, 2014.

Dear Mr. Terry:

The above-referenced request has been reviewed with regard to R.61-71 of the South Carolina Well Standards and Regulations. The request proposes the abandonment of four monitoring wells (DCB 16R, DCB 47C, DCB075, and DCB076) to support the removal action activities at the D-Area Ash Landfill (488-4D). The removal activities include the installation of a geosynthetic cover system that will meet the permeability, infiltration, and erosion control requirements of a SCDHEC Class III Landfill. These monitoring wells will be replaced after the geosynthetic cover system is installed. A program plan for the installation of the replacement wells will be submitted to the SCDHEC Federal Remediation Section as well as the Solid Waste Groundwater Section (pursuant to the Solid Waste Class II Landfill Permit #025800-1602) for approval prior to installation. The monitoring wells will be abandoned in accordance with SRS Procedures Manual 3Q1, Section 9000, "Hydrogeologic Data Collection Procedure and Specifications" and R.61-71 South Carolina Well Standards dated April 26, 2002.

SOUTH CAROLINA DEPARTMENT OF HEALTH AND ENVIRONMENTAL CONTROL
2600 Bull Street • Columbia, SC 29201 • Phone: (803) 898-3432 • www.scdhec.gov

Based on this review, approval is granted for the abandonment of the above-mentioned permanent monitoring wells. Should you have any questions regarding the above, please contact me at (803) 898-0909.

Sincerely,

Ashleigh Thrash

Re: Savannah River Site (SRS)/FFA
D-Area Operable Unit
SC1 890 008 989
Barnwell County

Request for Approval for the Savannah River Site Hydrogeologic/Geotechnical Well Abandonment Program Plan for the D-Area Ash Project (Wells around D-Area Ash Basin 488-1D) (ER-HGPP-2015-00018) (Terry to Fulmer), SRNS-J2000-2015-00730, dated December 1, 2015.

Dear Mr. Terry:

The above referenced request has been reviewed with regard to R.61-71 of the South Carolina Well Standards and Regulations. The request proposed the abandonment of ten (10) wells/piezometers (DA 4C, DB 5C, DB 6C, DA 7C, DB 10C, DA 11C, DA 12C, DB 13C, DA 14C, and 15C) that are located in the D-Area Ash Basin (488-1D) south and west berms, as the wells are no longer required due to closure of the basin. The monitoring wells/piezometers will be abandoned in accordance with SRS Procedures Manual 3Q1, Section 9010, "Well Abandonments" and R.61-71 South Carolina Well Standards dated April 26, 2002.

Based on this review, approval is granted for the abandonment of the above mentioned wells/piezometers **only if** the closure of the D-Area Ash Basin (488-1D) proceeds as scheduled. However, if the dewatering of the basin does not commence by March 2016, approval for the abandonment of these wells is not granted. Also, the Department acknowledges for accountability purposes the abandonment of vadose zone well, P-06. The above conditions apply to this vadose zone well as well. Should you have any questions regarding the above, please contact me at (803) 898-0916.

Sincerely,

Heather H Cathcart

Request for the Savannah River Site Hydrogeologic/Geotechnical Well Abandonment Program Plan for the D-Area Ash Project (Well East of the 488-4D Ash Landfill) (ER-HGPP-2016-00007), SRNS-J2000-2016-00472, dated July 28, 2016 and received July 29, 2016.

Dear Mr. Terry:

The above referenced request has been reviewed with regard to R.61-71 of the South Carolina Well Standards and Regulations. The request proposes the abandonment of one well, DCB 13R, located outside the 488-4D Ash Landfill to allow for the removal of the ash for consolidation in the 488-1D Ash Basin. Replacement wells, as needed, will be discussed and agreed upon by the U. S. Department of Energy, U. S. Environmental Protection Agency, and South Carolina Department of Health and Environmental Control. The monitoring well will be abandoned in accordance with the SRS Procedures Manual 3Q1, Section 9000, "Hydrogeologic Data Collection Procedure and Specifications" and R.61-71, South Carolina Well Standards dated May 27, 2016.

Based on this review, approval is granted for the abandonment of the above mentioned monitoring well, DCB 13R. Should you have any questions or concerns, please contact me at (803) 898-0916.

Sincerely,

Heather H. Cathcart

Re: Savannah River Site (SRS)/FFA
D Area Operable Unit
SC1 890 008 989
Barnwell County

Request for the Approval of the Savannah River Site Hydrogeologic and Geotechnical Projects Program Plan for the D-Area Ash Project – 488-4D Replacement Well Installation (DCB077, DCB078, DCB079, and DCB080) (ER-HGCP-2016-00013), SRNS-J2000-2016-00617, dated October 17, 2016 and received October 18, 2016.

Dear Mr. Terry:

The above referenced request has been reviewed with regard to R.61-71 of the South Carolina Well Standards and Regulations. The request proposes the installation of four replacement monitoring wells (DCB077, DCB078, DCB079, and DCB080) at the 488-4D Landfill. Three wells will be installed downgradient and one well will be installed upgradient of the landfill. In addition to the attached requirements, the Department will expect the following:

1) These groundwater monitoring well shall not penetrate the Green Clay Confining Unit.

2) All well construction and sampling derived waste, including but not limited to, drill cuttings, drilling fluids, and development and purge water, be managed properly and in accordance will all applicable state and federal requirements. If containerized, each vessel shall be clearly labeled with regard to contents, source, and date activity.

3) Field equipment (including sampling probes) must be decontaminated by steam cleaning (or another appropriate method) before use and between sampling locations. Well screens and casing must be decontaminated before installation.

4) That notice be given to the author of the approval and the Midlands EQC Region – Aiken office, Scott Simons (803-642-1637), a minimum of forty-eight hours prior to initiation of drilling activities.

These monitoring wells shall be installed in accordance with the specifications of SRS Procedures Manual, 3Q1, Section 9000, "Hydrogeologic Data Collection Procedure and Specifications" and R.61-71, South Carolina Well Standards dated May 27, 2016.

Based on this review, approval is granted for the installation of the above mentioned groundwater monitoring wells at the D Area Operable Unit. If the date of construction extends seven to ten days past November 14, 2016, please notify the Department immediately. Should you have any questions, you may contact me at (803) 898-0916.

Sincerely,

Heather H. Cathcart

Monitoring Well Approval

Date of Issuance: October 26, 2016 **Approval #:** MW-10871

Approval is hereby granted to: Mr. Benjamin C. Terry
Facility: Savannah River Site
SC1 890 008 989
Barnwell County

This approval is for the installation of four permanent groundwater monitoring wells. The monitoring wells are to be installed in the location illustrated on the figure and per the proposed construction details provided in the October 17, 2016 correspondence. The proposed state is date is November 14, 2016. The monitoring wells are to be installed following all of the applicable requirements of R.61-71.

Please note that R.61-71 requires the following:

1. All wells shall be drilled, constructed, and abandoned by a South Carolina certified well driller per R.61-71.D.1.

2. All wells shall be properly developed per R.61-71.H.2.d. A Water Well Record Form or other form provided or approved by the Department shall be completed and submitted within 30 days after well completion or abandonment unless another schedule has been approved by the Department. The form should contain the "as-built" construction details and all other information required by R.61-71.H.1.f.

3. All analytical data and water levels obtained from each monitoring well shall be submitted to the author of this approval within 30 days of receipt of laboratory results unless another schedule has been approved by the Department as required by R.61-71.H.1.d.

4. All monitoring wells shall be labeled as required by R.61-71.H.2.c.

5. If any of the information provided to the Department changes, including the proposed drilling date, the author (803-898-0916) shall be notified at least 24 hours prior to well construction as required by R.61-71.H.1.a.

This approval is pursuant to the provisions of Section 44-55-40 of the 1976 South Carolina Code of Laws and R.61-71 of the South Carolina Well Standards and Regulations, dated May 27, 2016.

Columbia, SC 29201

Dear Ms. Fulmer:

SUBMITTAL OF THE MONITORING WELL INSTALLATION REPORTS AND WELL DEVELOPMENT FIELD PARAMETERS FOR THE D-AREA ASH PROJECT – 488-4D REPLACEMENT WELL INSTALLATION (DCB077, DCB078, DCB079 AND DCB080) (ER-HGPP-2016-00013) (SCDHEC MONITORING WELL APPROVAL #MW-10871)

Reference:
Letter, H. H. Cathcart (SCDHEC) to B. C. Terry (SRNS), *Re: Savannah River Site (SRS)/FFA D Area Operable Unit Request for the Approval of the Savannah River Site Hydrogeologic and Geotechnical Projects Program Plan for the D-Area Ash Project - 488-4D Replacement Well Installation (DCB077, DCB078, DCB079, and DCB080) (ER-HGPP-2016-00013), SRNS-J2000-2016-00617, dated October 17, 2016 and received October 18, 2016*, dated October 26, 2016 (SRNS-OS-2016-00089)

In your letter dated October 26, 2016 (Reference 1), the South Carolina Department of Health and Environmental Control approved the installation of four replacement monitoring wells (DCB077, DCB078, DCB079, and DCB080). Three monitoring wells were installed downgradient and one monitoring well was installed upgradient. The Monitoring Well Installation Reports and Well Development Field Parameters for these groundwater monitoring wells and a figure showing the location of the wells are enclosed for your files.

If you have any questions or comments regarding this submittal, please contact Shelia McFalls at (803) 952-6819 or via email at shelia.mcfalls@srs.gov.

Sincerely,

Benjamin C. Terry, Manager
Environmental Permitting
Environmental Compliance & Area Completion Projects

Dear Ms. Fulmer:

SUBMITTAL OF THE WELL ABANDONMENT REPORTS FOR THE D-AREA ASH LANDFILL (488-4D) GROUNDWATER MONITORING WELLS DCB 16R, DCB 47C, DCB075, AND DCB076 (ER-HGPP-2014-00021)

Ref.: Letter, A. Thrash (SCDHEC) to B. C. Terry (SRNS), *RE: Savannah River Site (SRS)/FFA D-Area Ash Landfill (488-4D) SC1 890 008 989 Barnwell County Request for the Approval for the Abandonment of Groundwater Monitoring Wells in Support of the D-Area Ash Landfill (488-4D) Removal Action Activities (ER-HGPP-2014-00021), SRNS-J2000-2014-00357, dated July 23, 2014*), dated July 28, 2014 (SRNS-OS-2014-00053)

In their letter dated July 28, 2014, the South Carolina Department of Health and Environmental Control approved the abandonment of groundwater monitoring wells DCB 16R, DCB 47C, DCB075, and DCB076 in support of the removal action activities at the D-Area Ash Landfill (488-4D) (Reference 1). The Well Abandonment Reports for these wells are enclosed for your files.

Ms. Susan B. Fulmer, P.G., Manager
Federal Remediation Section
Division of Site Assessment, Remediation, and Revitalization
Bureau of Land and Waste Management
South Carolina Department of Health and Environmental Control
2600 Bull Street
Columbia, SC 29201

Dear Ms. Fulmer:

SUBMITTAL OF THE D-AREA ASH PROJECT (WELLS AROUND D-AREA ASH BASIN 488-1D) WELL ABANDONMENT REPORTS FOR MONITORING WELLS DA 4C, DB 5C, DA 7C, DB 10C, DA 11C, DA 12C, DB 13C, DA 14C, AND DB 15C (ER-HGPP-2015-00018) AND D-AREA ASH PROJECT (WELL EAST OF THE 488-4D ASH LANDFILL) WELL ABANDONMENT REPORT FOR MONITORING WELL DCB 13R (ER-HGPP-2016-00007)

References:

1. Letter, H. H. Cathcart (SCDHEC) to B. C. Terry (SRNS), *Re: Savannah River Site (SRS)/FFA D-Area Operable Unit SC1 890 008 989 Barnwell County Request for Approval for the Savannah River Site Hydrogeologic/Geotechnical Well Abandonment Program Plan for the D-Area Ash Project (Wells around D-Area Ash Basin 488-1D) (ER-HGPP-2015-00018) (Terry to Fulmer), SRNS-J2000-2015-00730, dated December 1, 2015*, dated December 3, 2015 (SRNS-OS-2015-00101)
2. Letter, H. H. Cathcart (SCDHEC) to B. C. Terry (SRNS), *Re: Savannah River Site (SRS)/FFA D-Area Operable Unit SC1 890 008 989 Barnwell County Request for the Savannah River Site Hydrogeologic/Geotechnical Well Abandonment Program Plan for the D-Area Ash Project (Well East of the 488-4D Ash Landfill) (ER-HGPP-2016-00007), SRNS-J2000-2016-00472, dated July 28, 2016 and received July 29, 2016*, dated August 4, 2016 (SRNS-OS-2016-00052)

In your letter dated December 3, 2015, the South Carolina Department of Health and Environmental Control (SCDHEC) conditionally approved the abandonment of ten monitoring wells/piezometers (i.e., DA 4C, DB 5C, DB 6C, DA 7C, DB 10C, DA 11C, DA 12C, DB 13C, DA 14C, and DB 15C) located in the D-Area Ash Basin (488-1D) south and west berms, as they are no longer required due to closure of the basin (Reference 1). All of these monitoring wells/piezometers, except DB 6C, were abandoned. DB 6C was not abandoned due to an oversight. DB 6C will be abandoned in Fiscal Year 2017 and the Well Abandonment Report will be submitted to you upon completion. In addition, in your letter dated August 4, 2016, the SCDHEC approved the abandonment of monitoring well DCB 13R, which is located outside the 488-4D Ash Landfill to allow for the removal of ash for consolidation in the 488-1D Ash Basin (Reference 2).

The Well Abandonment Reports for DA 4C, DB 5C, DA 7C, DB 10C, DA 11C, DA 12C, DB 13C, DA 14C, DB 15C, and DCB 13R are enclosed for your files.

Ms. Susan B. Fulmer

I. CONFIRMATION SAMPLES

1.0 PROJECT SUMMARY

This report presents analytical data verification, validation and usability assessment results for the soil confirmation sampling that was conducted in accordance with the *Field Sampling Plan for the 488-2D Ash Basin* (FSP) (SRNS 2015a) and presented in the *Human Health and Ecological Evaluation for Confirmation Sampling at the 488-2D Ash Basin* (SRNS 2016). The project generated 18 regular field samples (REG), 1 field duplicate sample (FD) and 1 split sample (SPL). A single rinsate blank (RB) was also collected. The samples, along with the requested analyses, are listed in Table 1.

Analyses Requested:
1. Chromium, Hexavalent
2. Mercury, Total Recovery
3. Uranium, Alpha Spectroscopy
4. Gamma Spectroscopy
5. ICP-MS Metals

A total of 651 analytical records were produced consisting of regular sample records and field quality control (QC) records (Table 2).

Table 2. Total Number of Records

Number of Records	Chemical	Radiochemical	Totals
Analytical	431	126	558
Field QC	72	21	93
Totals	503	147	651

The verification process was conducted to review completeness of the sampling and analytical requirements. Validation has been performed to assess compliance with methods, procedures, and contracts, and to assess a comparison with measurement performance criteria in the ER-SOP-033, *Analytical Data Qualification* (SRNS 2015b). A usability assessment will provide the data user with an assessment of whether the process execution and resulting data meet project quality objectives in the Quality Assurance Project Plan (QAPP) (SRNS 2012) and the *Confirmation Sampling and Analysis Plan for Coal and/or Ash Removal at the Savannah River Site* (SAP) (SRNS 2014). These processes involve examination of the FSP (SRNS 2015a) and SAP (SRNS 2014), electronic data files, the field data, analytical data, and laboratory records. Computer programs are used to verify that samples were properly preserved and were analyzed within the required holding time, that QC results were within specified acceptable ranges, and that the appropriate detection limits were employed by the laboratories. Additionally, manual reviews of field data and laboratory records are conducted to ensure the quality of these items. Validation summaries for holding time, preservation, calibration, analyte identification, and analyte quantitation can be found in subsections 3.1, *Holding Times*; 3.2, *Preservation*; and 3.3, *Calibration, Identification, and Quantitation.*

The data were validated to determine if the records conform to the technical criteria associated with definitive data per ER-SOP-033 (SRNS 2015b). Table 3 provides a brief validation summary for the project. Review qualifiers are assigned by a data validator internal to Savannah River Nuclear Solutions and external to the analytical laboratory. Environmental records include regular sample and field duplicate records.

2.0 ASSESSMENT OF PRECISION, ACCURACY, REPRESENTATIVENESS, COMPARABILITY, and COMPLETENESS DATA QUALITY INDICATORS (DQIs) AND MEASUREMENT PERFORMANCE CRITERIA

This section discusses the analytical data in terms of the following indicators of data quality: precision, accuracy, representativeness, comparability, and completeness. Precision is determined from the field and laboratory duplicate analyses and indicates the consistency of field and laboratory techniques. Accuracy is determined from the laboratory control samples (LCS), matrix spikes (MS), and the results of the method, field, trip, and rinsate blanks; it indicates the ability of the laboratory to generate correct results. Representativeness measures how well the data represents the sample population. Comparability expresses the confidence with which data from different laboratories are considered to be equivalent. Representative completeness measures the amount of data resulting from the data collection activity.

2.1 Precision

Precision is the degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves. Field duplicates measure the repeatability of the sampling and analytical techniques, and laboratory duplicates measure the ability of the laboratory to reproduce a result. Low precision can be caused by poor instrument performance, poor operator technique, inconsistent application of method protocols, laboratory environment, time between analyses, or by a difficult, heterogeneous sample matrix. Precision is especially important when the action limit approaches the quantification limit. At least 5% of the samples were collected in duplicate for this project. The laboratory performs duplicate analyses on at least 5% of the samples received.

Precision is expressed in terms of the relative percent differences (RPD) as follows:

$$\text{RPD} = \frac{|x - y|}{\left(\frac{x + y}{2}\right)} \times 100$$

where x is the original sample result and y is the duplicate sample result. When one result of a duplicate pair is below the MDL, the sample specific estimated quantification limit (ssEQL) is used for that result in the calculation. When both results are below the MDL, the RPD is not calculated.

The RPD should be less than 20% for water samples and less than 35% for solid samples when results are greater than the ssEQL. In the case where results are between the ssEQL and the MDL, the RPD should be less than 100% for water samples and less than 200% for soil samples. In the event analytical precision goals are not met, a determination of the usability of that information is made through the environmental data assessment process.

No records were rejected due to precision issues. Details for this project can be found in subsections 3.6, *Laboratory Duplicate RPD*; and 3.7, *Field Duplicate RPD*.

2.2 Accuracy

Accuracy is defined as the closeness of agreement between an observed value and an accepted reference value. Accuracy is especially important when the concentration of concern approaches the detection limit and/or the action limit. When the concentration is underestimated near the detection limit, the analyte may be present but reported as not detected. When the concentration is underestimated near the action limit, the analyte may be at a concentration that would require remediation, but the remediation would not be performed. When the concentration is overestimated near the detection limit, the analyte may not be present but reported as detected. When the concentration is overestimated near the action limit, the analyte may not be at a concentration that would require remediation, but the remediation would be performed. The sample types used to evaluate accuracy are performance evaluation studies, LCSs, surrogate spikes, MSs, method blanks, trip blanks, and rinsate blanks

LCSs monitor the performance of all steps in the analytical process, including sample preparation, and are used to identify problems with the analytical procedure. LCSs are deionized water that is spiked with the target analyte, digested, and analyzed with the regular samples. The LCS spiking solution is obtained from the Environmental Protection Agency, third-party supplier, or is prepared in the laboratory using chemical from a different source than the calibration standards.

The LCS percent recovery is calculated as follows:

$$\%\ \text{Recovery} = \frac{\text{Blank spike concentration}}{\text{Spike concentration}} \times 100$$

One hundred percent recovery is equivalent to 100% accuracy. Values less than 100% or greater than 100% may indicate a sample matrix effect and a false reading. A periodic program of sample spiking is required (e.g., one MS and one MS duplicate per 20 samples). In the event that analytical accuracy goals are not met, a determination is made through the environmental data assessment process relative to the usability of that information.

Details for this project can be found in subsections 3.5, *Method Blanks*; 3.8, *Matrix Spike Recovery*; 3.9, *LCS Recovery*; and 3.10, *Surrogate/Tracer Recovery*.

2.3 Representativeness

Representativeness is a measure of the degree to which data accurately and precisely represent a characteristic of a population, a parameter variation at a sampling point, a process condition, or an environmental condition. The representativeness of samples collected is controlled by adhering to the detailed descriptions of sampling procedures. The objective of this assessment is to accurately represent the concentrations of target analytes or compounds. Representative samples for this investigation will be required by implementing approved sampling and analytical procedures that will generate data representative of the sampling point location and will be maintained. Analytical methods are selected that will most accurately represent the true concentration of the parameter of interest. The accumulation of QC procedures and information

(i.e., RPD values, blank QC concentrations, MS percent recoveries, etc.) employed for a given analysis combine to exhibit the representativeness of the data generated.

The goal for representative sample data will therefore be met by properly documenting field and analytical protocols. In the event these procedures and methods are not able to be implemented, the appropriate corrective action documentation should encompass the impact on the representativeness of the information. When review of the data and documentation determines the data to be non-representative, the information is qualified in its use or is not used by the project.

All samples were collected and analyzed per established procedures.

2.4 Comparability

Comparability is the degree to which different methods, data sets, and decisions agree or can be represented as similar. The comparability of the data from the laboratories is based on the results of the split samples and on confirmation that the laboratories used the same standardized procedures for sample analysis, the same reporting unit, and obtained similar quantitation limits. Comparability of the data produced for this investigation may be obtained by implementing the identified protocols for sampling and analysis of samples. Implementation of traceable reference materials such as laboratory standards, expression of results in standard concentration units, and successful participation by the laboratories in external performance evaluation programs will enable the information produced through this investigation to be compared with future data sets, if required. For at least 5% of the sample locations, a split sample is collected and sent to the designated QC laboratory.

One split soil sample from one location was collected for this project in accordance with the approved FSP (SRNS 2015a). Details for the split sample can be found in subsection *3.11, Split Samples Comparability.*

2.5 Completeness

Completeness is a measure of the amount of valid data obtained from a measurement system compared with the amount that was expected to be obtained under correct, normal circumstances. The Quality Assurance (QA) completeness objective for Resource Conservation and Recovery Act Facility Investigation/Remedial Investigation projects is to obtain valid field and laboratory analytical results for at least 90% of the samples collected during the project. This implies that completeness of sample collection (i.e., the number of samples collected compared to the number of samples planned) must be virtually 100% to allow for some loss of data during the laboratory analytical process. Accountability of samples collected, from field to final disposal, must be 100%.

Completeness is a measure of the amount of data obtained from a measurement process that achieves the project goals as compared to the amount of data planned to be obtained by the project. Completeness is affected by unexpected conditions during the data collection process that reduce the usable data achieved relative to the data planned.

When review of the data and documentation determines the data to be incomplete, the impact relative to the project objective will be assessed and documented.

The following are measures of completeness:

Sample Collection:

$$\text{Completeness} = \frac{\text{Number of Sample Points Sampled}}{\text{Number of Sample Points Planned}} \times 100$$

Field Measurement:

$$\text{Completeness} = \frac{\text{Number of Valid Measurements Made}}{\text{Number of Measurements Planned}} \times 100$$

Laboratory Analysis:

$$\text{Completeness} = \frac{\text{Number of Valid Data Points}}{\text{Number of Data Points Planned}} \times 100$$

The completeness numbers for this project are listed below:

Sample Collection Completeness	100%
Field Measurement Completeness	100%
Laboratory Analysis Completeness	100%

3.0 VALIDATION FINDINGS

3.1 Holding Times

All holding times for the reported analyses were within the recommended limits. No qualification was required.

3.5 Method Blanks

EPA6010C, ICP Metals

One record was qualified as estimated (J-qualified) due to the detection of antimony in the method blank (V-qualified). Record qualified as J/V.

Four records were qualified as non-detect (U-qualified) due to the detection of antimony in the method blank, U/V.

EPA6020A, ICP-MS Metals

One record was qualified as non-detect due to the detection of antimony in the method blank, U/V.

Eleven records were qualified as estimated due to the detection of zinc in the method blank, J/V.

EPA7196A, Chromium, Hexavalent

Two records were qualified as non-detect due to the detection of hexavalent chromium in the method blank, U/V.

Three records were qualified as estimated due to the detection of hexavalent chromium in the method blank, J/V.

RADA-011, Alpha Spectroscopy

Two records were qualified as estimated due to the detection of uranium-233/234 in the method blank, J/V.

Ten records were qualified as non-detect due to the detection of uranium-235 in the method blank, U/V.

Two records were qualified as estimated due to the detection of uranium-235 in the method blank, J/V.

3.8 Matrix Spike Recovery

Table 11. Matrix Spike (MS) Recovery Qualifier Summary

Method Code	Total # of MS/MSD Records	# of MS/MSD Records Qualified	Associated Samples Qualified
EPA6010C	15	2	DAAB4882D-006, DAAB4882D-007
EPA6020A	74	26	DAAB4882D-006, DAAB4882D-007, DAAB4882D-008, DAAB4882D-013, DAAB4882D-018
EPA7471B	8	0	Not Required
EPA7196A	12	0	Not Required

EPA6010C, ICP Metals

Two antimony records were qualified as approximate because the MS/Matrix Spike Duplicate (MSD) recovery was outside the established control limits, UJ/11.

EPA6020A, ICP-MS Metals

Two boron records were qualified as approximate because the MS/MSD recovery was outside the established control limits, UJ/11.

One boron record was qualified as estimated because the MS/MSD recovery was outside the established control limits, J/11.

Three chromium records were qualified as estimated because the MS/MSD recovery was outside the established control limits, J/11.

Two copper records were qualified as because the MS/MSD recovery was outside the established control limits, J/11.

Two lead records were qualified as estimated because the MS/MSD recovery was outside the established control limits, J/11.

Four magnesium records were qualified as estimated because the MS/MSD recovery was outside the established control limits, J/11.

Four molybdenum records were qualified as estimated because the MS/MSD recovery was outside the established control limits, J/11.

One strontium record was qualified as estimated because the MS/MSD recovery was outside the established control limits, J/11.

Three selenium records were qualified as estimated because the MS/MSD recovery was outside the established control limits, J/11.

Three zinc records were qualified as estimated because the MS/MSD recovery was outside the established control limits, J/11.

3.9 LCS Recovery

Table 12. LCS Qualifier Summary

Method Code	Total # of LCS Records	# of LCS Records Qualified	Associated Samples Qualified
A-01-RMOD	3	0	Not Required
RADA-011	60	0	Not Required
GA-01-RMOD	4	0	Not Required
RADA-013	80	0	Not Required
EPA6010C	39	0	Not Required

EPA7470A	1	0	Not Required
EPA7471B	20	0	Not Required
EPA7196A	21	0	Not Required

One antimony record was qualified as non-detect due to LCS criteria not being met, U/2.

3.10 Surrogate/Tracer Recovery

All tracer and surrogate recovery criteria for the reported analyses for the reported analyses were within the recommended limits. No qualification was required.

Table 13. Surrogate/Tracer Recovery Qualifier Summary

Method Code	Total # of LCS Records	# of LCS Records Qualified	Associated Samples Qualified
A-01-RMOD	3	0	Not Required
RADA-011	60	0	Not Required
GA-01-RMOD	4	0	Not Required
RADA-013	80	0	Not Required

3.11 Split Samples Comparability

Split soil samples were taken from one location and were analyzed by the same methodologies and two different laboratories (General Engineering Labs and Test America Labs).

Table 14. Split Samples

Station ID	Sample ID	Interval *(ft)*	Date/Time	Sample Type	Matrix	Labs
4882DAB-05	DAAB4882D-007	0-1	7/23/15 0845	REG	SOIL	GEL
4882DAB-05	DAAB4882D-008	0-1	7/23/15 0845	SPL	SOIL	TAL

Thallium was detected at 260 µg/kg at the General Engineering Lab and 790 µg/kg at the Test America Lab, however both results were detected above each of the Labs' method detection limits but below each Lab's sample quantitation limits and both thallium results were qualified, J/21.

4.0 DATA USABILITY

All analytical data associated with this project should be considered usable for the purposes outlined in the *Field Sampling Plan for the 488-2D Ash Basin* (SRNS 2015a) and the *Human Health and Ecological Evaluation for Confirmation Sampling at the 488-2D Ash Basin* (SRNS 2016). There are no limitations noted for the data associated with this project. Qualification details are found in Section 3.0, Validation Findings.

1. Sample Reception

Eleven (11) soil samples were submitted for hexavalent chromium and total chromium analyses. The samples were received in acceptable condition on September 2, 2015 in a sealed container at 5.0°C.

All samples were received in a laminar flow clean hood void of trace metals contamination and ultra-violet radiation. Upon reception, all samples were designated discrete sample identifiers. All samples were then stored in a secure, monitored refrigerator (maintained at a temperature of ≤6°C) until preparation and analysis could be performed.

2. Sample Preparation

All sample preparation is performed in laminar flow clean hoods known to be free from trace metals contamination. All applied water for dilutions and sample preservatives are monitored for contamination to account for any biases associated with the sample results.

Hexavalent Chromium Quantitation by EPA 7199 Mod. All samples were extracted using EPA Method 3060A. In summary, a known mass of each sample was weighed into a polypropylene centrifuge tube and $MgCl_2$, a phosphate buffer solution, and a buffered alkaline extraction solution were added to each vial. All vials were then heated, with continuous stirring, at 90-95°C in a hotblock apparatus for a minimum of one (1) hour. The resulting extracts were cooled, filtered (0.45µm), and injected directly into sealed autosampler vials prior to analysis for hexavalent chromium.

Hexavalent Chromium Quantitation by EPA Method 6800 All samples were extracted using a modified EPA Method 3060A. In summary, a known mass of each was added to a polyethylene centrifuge tube which contains $MgCl_2$. Each sample was then amended with a known amount of isotopically enriched trivalent and hexavalent chromium (^{50}Cr and ^{53}Cr, respectively) in accordance with the projected native concentrations. An alkaline extraction solution and a phosphate buffer solution were applied to each sample. All vials were then heated, with continuous stirring, at 90-95°C in a hotblock apparatus for a minimum of one (1) hour. The

resulting extracts were cooled, filtered (0.45µm), and injected directly into sealed autosampler vials prior to analysis for hexavalent chromium.

Total Chromium Quantitation A known mass of each sample was weighed into a polypropylene vial. All samples were then digested with aliquots of concentrated HNO_3 and H_2O_2 in a hot block apparatus, in accordance with EPA Method 3050B. The resulting digests were analyzed for total chromium.

Total Solids Determination A known mass of each sample was placed into a pre-weighed pan, and the combined mass of the sample and pan was recorded. All samples were then placed into a convection oven maintained at a temperature of 110°C. After drying for a minimum of sixteen (16) hours, all samples were briefly cooled and reweighed. The total solids percentage of each sample was calculated by dividing the weight of the dried sample by the weight of the original sample.

3. Sample Analysis

All sample analysis is preceded by a minimum of a five-point calibration curve spanning the entire concentration range of interest. All calibration curves, associated with each species of interest, are standardized by linear regression resulting in a response factor. All sample results are **instrument blank corrected** to account for any operational biases associated with the analytical platform. All sample results for hexavalent chromium and total chromium have also been **dry weight corrected** in accordance with the measured total solids concentrations.

Prior to sample analysis, all calibration curves are verified using second source standards which are identified as initial calibration verification standards (ICV).

Ongoing instrument performance is identified by the analysis of continuing calibration verification standards (CCV) and continuing calibration blanks (CCB) at a minimum interval of every ten analytical runs.

Hexavalent Chromium Quantitation by EPA 7199 Mod. All sample extracts for hexavalent chromium quantitation were analyzed via a modified version of EPA Method 7199, employing ion chromatography inductively coupled plasma dynamic reaction cell mass spectrometry (IC-ICP-DRC-MS). Aliquots of each sample are injected onto an anion exchange column and mobilized by an alkaline (pH > 7) gradient. The eluting chromium species are then introduced into a radio frequency (RF) plasma where energy-transfer processes cause desolvation, atomization, and ionization. The ions are extracted from the plasma through a differentially-pumped vacuum interface and travel through a pressurized chamber (DRC) containing a specific reactive gas which preferentially reacts with interfering ions of the same target mass to charge (m/z) ratios. A solid-state detector detects ions transmitted through the mass analyzer, on the basis of their mass-to-charge ratio (m/z), and the resulting current is processed by a data handling system.

The retention time for hexavalent chromium is compared to known standards for species identification.

Hexavalent Chromium Quantitation by EPA Method 6800 All samples for hexavalent chromium quantitation were analyzed by EPA Method 6800 (speciated isotope dilution mass spectrometry, or SIDMS), employing ion chromatography inductively coupled plasma dynamic reaction cell mass spectrometry (IC-ICP-DRC-MS). Aliquots of each sample are injected onto an anion exchange column and mobilized by an alkaline (pH > 7) gradient. The eluting chromium species are then introduced into a radio frequency (RF) plasma where energy-transfer processes cause desolvation, atomization, and ionization. The ions are extracted from the plasma through a differentially-pumped vacuum interface and travel through a pressurized chamber (DRC) containing a specific reactive gas which preferentially reacts with interfering ions of the same target mass to charge ratios (m/z). A solid-state detector detects ions transmitted through the mass analyzer, on the basis of their mass-to-charge ratio (m/z), and the resulting current is processed by a data handling system. Mass-to-charge ratios of 50, 52, and 53 are monitored during the analysis and the ratios are applied for quantitation purposes, as detailed in EPA Method 6800. Samples are analyzed in triplicate with the average being reported for each sample.

The retention times for trivalent and hexavalent chromium are compared to known standards for species identification.

Total Chromium Quantitation All sample digests for total chromium quantitation were analyzed via a modified EPA Method 200.8, employing inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). Aliquots of each sample digest are introduced into a radio frequency (RF) plasma where energy-transfer processes cause desolvation, atomization, and ionization. The ions are extracted from the plasma through a differentially-pumped vacuum interface and travel through an initial quadrupole (Q1), which filters the target masses prior to their entrance into a second chamber. The second chamber contains specific reactive gasses or collision gasses that preferentially react either with interfering ions of the same target mass to charge ratios (m/z) or with the target analyte, producing an entirely different mass to charge ratio (m/z) which can then be differentiated from the initial interferences. The ions then exit the collision/reaction chamber into the mass analyzer (Q2). A solid-state detector detects ions transmitted through the mass analyzer, on the basis of their mass-to-charge ratio (m/z), and the resulting current is processed by a data handling system.

4. Analytical Issues and Discussion

No significant issues were encountered with the requested analyses. All quality control parameters associated with these samples were within acceptance limits with the following exceptions:

For Batch NC00138, the third replicate of NC00138-BLK2 (identified as NC00138-BLK2 AT) was misinjected by the instrument. Since the remaining two replicates associated with this blank were properly injected, no corrective action was taken. The result for NC00138-BLK2 has been calculated as the average of the first two injections.

For Batch NC00149, spurious chromium peaks were observed in the chromatograms associated with several of the method blanks. These peaks did not directly overlap the integration windows for the target chromium species in any of the samples, except that of the first replicate associated with NC00149-BLK4. Since the remaining two replicates associated with this blank were properly injected, no corrective action was taken. The result for NC00149-BLK4 has been calculated as the average of the last two injections.

The RPD associated with the duplicate performed on sample N15I011-11 was above the control limit of 25% for Batch NC00138 (NC00138-DUP1, RPD of 34%). A triplicate set (including NC00138-DUP1 and NC00138-DUP2) was performed on this sample, and the associated RSD was within control at 18%. Visual inspection of sample N15I011-11 indicated that the matrix was heterogeneous in nature. The elevated duplicate RPD therefore reflects the sample heterogeneity and does not impact the validity of the reported results.

An important aspect of using isotopic ratios for quantitation purposes via EPA 6800 is ensuring that the measured signal for the target chromium isotopes is significantly above that associated with the background of the method. When the measured signal for a target isotope for a given chromium species is near that of the background, greater variability in the measured isotope ratio and therefore the final calculated sample result will occur. Each SIDMS result with a measured signal to background ratio of less than three for any hexavalent chromium isotope have been flagged (J-1) to indicate the greater variability associated with these results.

The SIDMS results obtained for sample 4882DAB-31 and its associated triplicate set (NC00149-DUP1 and NC00149-DUP2) were significantly below that of the method blanks for this batch (NC00149). These results have been flagged (X-1) in the attached report to indicate that they should be considered non-detects, but have been presented in an uncensored form for quality control evaluation purposes.

It should be noted that the RPDs associated with the matrix spike duplicates have been updated in this revised report. Although all MS/MSD RPDs are still within established control limits, the MS/MSD RPDs presented in the initial report were incorrectly calculated using the results (in mg/kg) obtained for the MS and MSD instead of the percent recoveries obtained for these spikes.

It should be noted that the method detection limit (MDL) for hexavalent chromium by EPA 7199 Mod has been calculated as three times the standard deviation of replicate analyses of the lowest standard in the calibration curve. The MDL for total chromium has been calculated as three times the standard deviation of the method blanks prepared and analyzed concurrently with the submitted samples.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more details, please see the Report

Information page in your report. Please feel free to contact me if you have any questions regarding this report.

Sincerely,

Ben Wozniak

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations /certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Common Abbreviations

BLK	method blank	**MS**	matrix spike
BAL	Brooks Applied Labs	**MSD**	matrix spike duplicate
BS	laboratory fortified blank	**ND**	non-detect
CAL	calibration standard	**NR**	non-reportable
CCB	continuing calibration blank	**N/C**	not calculated
CCV	continuing calibration verification	**PS**	post preparation spike
COC	chain of custody record	**REC**	percent recovery
D	dissolved fraction	**RPD**	relative percent difference
DUP	duplicate	**RSD**	relative standard deviation
IBL	instrument blank	**SCV**	secondary calibration verification
ICV	initial calibration verification	**SOP**	standard operating procedure
MDL	method detection limit	**SRM**	standard reference material
MRL	method reporting limit	**T**	total recoverable fraction

Definition of Data Qualifiers

(Effective 9/23/09)

J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Result is estimated.
J-1	Greater variability is associated with this result. A full explanation is presented in the narrative.
J-M	Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.
J-N	Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.
M	Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.
N	Spike recovery was not within acceptance criteria. Result is estimated.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X-1	Result should be considered a non-detect (ND). A full explanation is presented in the narrative.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

Brooks Applied Labs

Report Prepared for:

North Wind, Inc. - Greenville
ATTN: Allison Walker
535 N. Pleasantburg Drive, Suite 136
Greenville SC 29607

November 11, 2015

1. Sample Reception

Six (6) soil samples were submitted for hexavalent chromium and total chromium analyses. The samples were received in acceptable condition on October 9, 2015 in a sealed container at 3.5°C.

All samples were received in a laminar flow clean hood void of trace metals contamination and ultra-violet radiation. Upon reception, all samples were designated discrete sample identifiers. All samples were then stored in a secure, monitored refrigerator (maintained at a temperature of ≤6°C) until preparation and analysis could be performed.

2. Sample Preparation

All sample preparation is performed in laminar flow clean hoods known to be free from trace metals contamination. All applied water for dilutions and sample preservatives are monitored for contamination to account for any biases associated with the sample results.

Hexavalent Chromium Quantitation by EPA 7199 Mod. All samples were extracted using EPA Method 3060A. In summary, a known mass of each sample was weighed into a polypropylene centrifuge tube and $MgCl_2$, a phosphate buffer solution, and a buffered alkaline extraction solution were added to each vial. All vials were then heated, with continuous stirring, at 90-95°C in a hotblock apparatus for a minimum of one (1) hour. The resulting extracts were cooled, filtered (0.45µm), and injected directly into sealed autosampler vials prior to analysis for hexavalent chromium.

Hexavalent Chromium Quantitation by EPA Method 6800 All samples were extracted using a modified EPA Method 3060A. In summary, a known mass of each was added to a polyethylene centrifuge tube which contains $MgCl_2$. Each sample was then amended with a known amount of isotopically enriched trivalent and hexavalent chromium (^{50}Cr and ^{53}Cr, respectively) in accordance with the projected native concentrations. An alkaline extraction solution and a phosphate buffer solution were applied to each sample. All vials were then heated, with continuous stirring, at 90-95°C in a hotblock apparatus for a minimum of one (1) hour. The

resulting extracts were cooled, filtered (0.45µm), and injected directly into sealed autosampler vials prior to analysis for hexavalent chromium.

Total Chromium Quantitation A known mass of each sample was weighed into a polypropylene vial. All samples were then digested with aliquots of concentrated HNO_3 and H_2O_2 in a hot block apparatus, in accordance with EPA Method 3050B. The resulting digests were analyzed for total chromium.

Total Solids Determination A known mass of each sample was placed into a pre-weighed pan, and the combined mass of the sample and pan was recorded. All samples were then placed into a convection oven maintained at a temperature of 110°C. After drying for a minimum of sixteen (16) hours, all samples were briefly cooled and reweighed. The total solids percentage of each sample was calculated by dividing the weight of the dried sample by the weight of the original sample.

3. Sample Analysis

All sample analysis is preceded by a minimum of a five-point calibration curve spanning the entire concentration range of interest. All calibration curves, associated with each species of interest, are standardized by linear regression resulting in a response factor. All sample results are **instrument blank corrected** to account for any operational biases associated with the analytical platform. All sample results for hexavalent chromium and total chromium have also been **dry weight corrected** in accordance with the measured total solids concentrations.

Prior to sample analysis, all calibration curves are verified using second source standards which are identified as initial calibration verification standards (ICV).

Ongoing instrument performance is identified by the analysis of continuing calibration verification standards (CCV) and continuing calibration blanks (CCB) at a minimum interval of every ten analytical runs.

Hexavalent Chromium Quantitation by EPA 7199 Mod. All sample extracts for hexavalent chromium quantitation were analyzed via a modified version of EPA Method 7199, employing ion chromatography inductively coupled plasma dynamic reaction cell mass spectrometry (IC-ICP-DRC-MS). Aliquots of each sample are injected onto an anion exchange column and mobilized by an alkaline (pH > 7) gradient. The eluting chromium species are then introduced into a radio frequency (RF) plasma where energy-transfer processes cause desolvation, atomization, and ionization. The ions are extracted from the plasma through a differentially-pumped vacuum interface and travel through a pressurized chamber (DRC) containing a specific reactive gas which preferentially reacts with interfering ions of the same target mass to charge (m/z) ratios. A solid-state detector detects ions transmitted through the mass analyzer, on the basis of their mass-to-charge ratio (m/z), and the resulting current is processed by a data handling system.

The retention time for hexavalent chromium is compared to known standards for species identification.

Hexavalent Chromium Quantitation by EPA Method 6800 All samples for hexavalent chromium quantitation were analyzed by EPA Method 6800 (speciated isotope dilution mass spectrometry, or SIDMS), employing ion chromatography inductively coupled plasma dynamic reaction cell mass spectrometry (IC-ICP-DRC-MS). Aliquots of each sample are injected onto an anion exchange column and mobilized by an alkaline (pH > 7) gradient. The eluting chromium species are then introduced into a radio frequency (RF) plasma where energy-transfer processes cause desolvation, atomization, and ionization. The ions are extracted from the plasma through a differentially-pumped vacuum interface and travel through a pressurized chamber (DRC) containing a specific reactive gas which preferentially reacts with interfering ions of the same target mass to charge ratios (m/z). A solid-state detector detects ions transmitted through the mass analyzer, on the basis of their mass-to-charge ratio (m/z), and the resulting current is processed by a data handling system. Mass-to-charge ratios of 50, 52, and 53 are monitored during the analysis and the ratios are applied for quantitation purposes, as detailed in EPA Method 6800. Samples are analyzed in triplicate with the average being reported for each sample.

The retention times for trivalent and hexavalent chromium are compared to known standards for species identification.

Total Chromium Quantitation All sample digests for total chromium quantitation were analyzed via a modified EPA Method 200.8, employing inductively coupled plasma triple quadrupole mass spectrometry (ICP-QQQ-MS). Aliquots of each sample digest are introduced into a radio frequency (RF) plasma where energy-transfer processes cause desolvation, atomization, and ionization. The ions are extracted from the plasma through a differentially-pumped vacuum interface and travel through an initial quadrupole (Q1), which filters the target masses prior to their entrance into a second chamber. The second chamber contains specific reactive gasses or collision gasses that preferentially react either with interfering ions of the same target mass to charge ratios (m/z) or with the target analyte, producing an entirely different mass to charge ratio (m/z) which can then be differentiated from the initial interferences. The ions then exit the collision/reaction chamber into the mass analyzer (Q2). A solid-state detector detects ions transmitted through the mass analyzer, on the basis of their mass-to-charge ratio (m/z), and the resulting current is processed by a data handling system.

4. Analytical Issues and Discussion

No significant issues were encountered with the requested analyses. All quality control parameters associated with these samples were within acceptance limits with the following exceptions:

The RPD associated with the duplicate performed on sample 1541071-01 was above the control limit of 25% for hexavalent chromium in Batch B151675 (B151675-DUP1, RPD of 29%). The native sample and duplicate were re-analyzed, and the elevated RPD was confirmed; therefore, the results associated with the initial analyses have been reported. Visual inspection of sample 1541071-01 indicated that the matrix was heterogeneous in nature. The

elevated duplicate RPD therefore reflects the sample heterogeneity and does not impact the validity of the reported results.

The RPD associated with the duplicate performed on sample 1541071-01 was above the control limit of 25% for hexavalent chromium in Batch B151887 (B151887-DUP1, RPD of 37%). A triplicate set (including B151887-DUP1 and B151887-DUP2) was performed on this sample, and the associated RSD was within control at 19%. As previously mentioned, a visual inspection of sample N15I011-11 indicated that the matrix was heterogeneous in nature. Therefore, the elevated RPD obtained for B151887-DUP1 is attributed to the heterogeneity of the submitted sample.

An important aspect of using isotopic ratios for quantitation purposes via EPA 6800 is ensuring that the measured signal for the target chromium isotopes is significantly above that associated with the background of the method. When the measured signal for a target isotope for a given chromium species is near that of the background, greater variability in the measured isotope ratio and therefore the final calculated sample result will occur. Each SIDMS result with a measured signal to background ratio of less than three for any hexavalent chromium isotope has been flagged (J-1) to indicate the greater variability associated with these results.

It should be noted that the method detection limit (MDL) for hexavalent chromium by EPA 7199 Mod has been calculated as three times the standard deviation of replicate analyses of the lowest standard in the calibration curve. The MDL for total chromium has been calculated as the average of the four method blanks plus three times the standard deviation of the method blanks.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. BAL, an accredited laboratory, certifies that the reported results of all analyses for which BAL is NELAP accredited meet all NELAP requirements. For more details, please see the Report Information page in your report. Please feel free to contact me if you have any questions regarding this report.

Sincerely,

Ben Wozniak

Report Information

Laboratory Accreditation

BAL is accredited by the *National Environmental Laboratory Accreditation Program* (NELAP) through the State of Florida Department of Health, Bureau of Laboratories (E87982) and is certified to perform many environmental analyses. BAL is also certified by many other states to perform environmental analyses. For a current list of our accreditations/certifications, please visit our website at <http://www.brooksapplied.com/resources/certificates-permits/>. Results reported relate only to the samples listed in the report.

Field Quality Control Samples

Please be notified that certain EPA methods require the collection of field quality control samples of an appropriate type and frequency; failure to do so is considered a deviation from some methods and for compliance purposes should only be done with the approval of regulatory authorities. Please see the specific EPA methods for details regarding required field quality control samples.

Definition of Data Qualifiers

(Effective 9/23/09)

J	Detected by the instrument, the result is > the MDL but ≤ the MRL. Result is reported and considered an estimate.
E	An estimated value due to the presence of interferences. A full explanation is presented in the narrative.
H	Holding time and/or preservation requirements not met. Result is estimated.
J-1	Greater variability is associated with this result. A full explanation is presented in the narrative.
J-M	Duplicate precision (RPD) for associated QC sample was not within acceptance criteria. Result is estimated.
J-N	Spike recovery for associated QC sample was not within acceptance criteria. Result is estimated.
M	Duplicate precision (RPD) was not within acceptance criteria. Result is estimated.
N	Spike recovery was not within acceptance criteria. Result is estimated.
R	Rejected, unusable value. A full explanation is presented in the narrative.
U	Result is ≤ the MDL or client requested reporting limit (CRRL). Result reported as the MDL or CRRL.
X	Result is not BLK-corrected and is within 10x the absolute value of the highest detectable BLK in the batch.
	Result is estimated.

These qualifiers are based on those previously utilized by Brooks Applied Labs, those found in the EPA SOW ILM03.0, Exhibit B, Section III, pg. B-18, and the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review; USEPA; January 2010. These supersede all previous qualifiers ever employed by BAL.

INTRODUCTION

This report discusses the data validation of a Level IV data package generated by Brooks Applied Labs located at 18804 North Creek Parkway, Suite 100, Bothell, Washington 98011. The data package was received on November 3, 2015, loaded on a CD. The data validator performed a Level IV data validation examination, as per EPA and DoD-DOE QSM requirements. The type of validation process involves a comprehensive examination of every facet of the analyses represented by and documented in the data package. This report will provide details of this process and will discuss the quality of the data and any effects the data quality have on the reported results. A data summary spreadsheet will also be provided to enable the user to easily view all the data and data qualifiers applied as a result of the data validation process.

SUMMARY OF PROJECT

This project entailed the sampling of eleven (11) soil samples for the analysis of Chromium. In particular, the samples were analyzed for Total Chromium, Hexavalent Chromium (Cr VI), and Total Solids (in order to provide a correction factor so that results could be reported on a "dry weight" basis). Several methods for sample analysis were utilized by the laboratory, which are discussed in the next section.

SUMMARY OF METHODS

Three methods were used to determine Chromium concentrations in the 11 samples submitted for analysis. The following is a brief explanation of these methods and why three methods were utilized.

EPA method 200.8: ICP-MS (Inductively Coupled Plasma triple quadrupole- Mass Spectroscopy) analysis for Total Chromium

This method is used to determine the presence of and concentrations of over 60 metal elements in a wide variety of samples. In this method, samples are digested and then introduced into a radio frequency plasma, where the analytes are desolved, atomized and ionized. The ions so produced are transferred from the plasma to a triple quadrupole (QQQ) filter and the ions of interest are then transferred to a triple quadrupole filter, which filters target masses, then these mass ions are transferred to a mass analyzer, which detects and quantifies the metal analytes of interest. The resulting signal is then converted to usable data via a data handling system. The results labeled "Cr" were generated in this manner.

EPA Method 7199: ICP-DRC-MS (ICP - plasma dynamic reaction cell - MS) for Hexavalent Chromium (Cr VI)

This method involved all the capabilities of method 200.8, with added sample preparation steps. These added steps include passing the digestates of samples through an ion-exchange column, which is followed by adjustment of the pH to greater than 7. This mobilizes the chromium ions (one of which is

Cr VI), which is then passed through a DRC chamber which preferentially reacts with Cr VI. The signal is then collected and results for Cr (VI) are generated via the data handling system.

EPA Method 6800: IC-ICP-DRC-MS

This method is similar to the 7199 method, with an important difference. For method 6800, various isotopes of Chromium are detected, which gives rise to the acronym used for this method: SIDMS (Speciated isotope dilution MS). This method of analysis is essentially free from interferences and can determine specific species of Chromium by the use of labeled isotopes of Chromium (Cr-50, Cr-52 and Cr-53) for each species (oxidation state), which are detected by their individual retention times. This method works even if the Cr (VI) has degraded to Cr (III) during the sample preparation or analysis. Proponents of this method claim that it is the most reliable method for determining specific oxidation states of metal ions in a variety of matrices.

The total chromium value is the sum of the Cr (III) and Cr (VI) results. Once one knows the Total Chromium (Cr (III) + Cr (VI)) value, and when the Cr (VI) concentration is determined, the Cr (III) can be calculated by difference. In most cases, Cr (III) makes up a large component of the total chromium result, as can be seen in the data presented for this project. Cr (VI) is environmentally and toxicologically important, which is the reason for the analysis.

Standard method 2540G: Total Solids

This is a simple method for determining percent solids of a solid sample. A known mass of sample is dried in an oven for a period of time, and the loss of mass is attributed to water that has been driven off. The dry mass divided by the original mass is calculated and a percent solids value is derived from that result. The initial ("wet") concentration result for an analyte is then divided by the percent solids value to obtain the "dry weight" result.

SPECIFIC DATA PACKAGE INFORMATION

The data package received by the project chemist is 529 pages in length. It is divided into several main sections:

- Introduction and overview
- Sample results and analytical batch information
- QC summary (accuracy and precision)
- Calibration information
- Chain of Custody and sample container summary
- Raw analytical data for five sample analysis batches

All necessary data were present and complied with the detail and completeness required for a Level IV data package. The Project chemist was able to utilize all the contents of the data package in order to perform the level IV data validation process. In addition, the thorough examination of the data

deliverables also serves as the Data Verification activity (also known as Contract Compliance Screening, CCS, by some entities).

Sample IDs

The following 11 samples were submitted for analysis:

4882DAB-21 4882DAB-22 4882DAB-23 4882DAB-24 4882DAB-25 4882DAB-26

4882DAB-27 4882DAB-28 4882DAB-29 4882DAB-30 4882DAB-31

Sample Collection and Receipt

They were all collected on August 31, 2015. All samples were received by the laboratory on September 2, 2015 in good condition.

QC SUMMARY

QC Indicators

The following QC indicators were employed for these analyses:

- Method blank (MBLK)
- Calibration verification standards (ICV, CCV)
- Matrix spike analysis (MS)
- Matrix Spike Duplicate analyses (MSD)
- Laboratory control samples: Certified reference materials (CRMs) and Standard Reference materials (SRMs), Laboratory fortified Blanks
- Laboratory duplicates (DUP)

QC results

Each of the above QC indicator results were examine to determine if (a) there were unacceptable results and (b) if so, what effects these unacceptable results would have on the results. "Unacceptable" means that the blank values, MS/MSD % recoveries, laboratory duplicate precision (RPD), SRM and CRM % recoveries are outside of acceptable limits.

The following is the summary of QC indicator performance:

- Method blank (MBLK): The Method 6800 Method blanks produced results that are greater than the method detection limits (MDLs). A maximum value of 0.031 mg/kg was obtained. All other blanks for the other methods were acceptable.
- Calibration verification standards (ICV, CCV): All ICV and CCV recoveries were within acceptable ranges of 90-110%.
- Matrix spike analysis (MS): all MS recoveries were within acceptable ranges of 80-120%.
- Matrix Spike Duplicate analyses (MSD): All MSD recoveries were within acceptable ranges of 80-120%.
- Laboratory control samples: (Certified reference materials (CRMs) and Standard Reference materials (SRMs), Laboratory fortified Blanks): All SRM, CRM and Lab fortified blank recoveries were within the acceptable range of 80-120%.
- Laboratory duplicates (DUP): Laboratory duplicate relative percent difference (RPD) values were less than 35%, which is considered acceptable for solid matrix result precision.

Qualified results based on QC results

Based on the foregoing QC result summary, the following results are affected:

The CR (VI) results generated by the EPA 6800 method for Samples 4882DAB-25, 4882DAB-30, and 4882DAB-31 should be considered undetected due to blank contamination. These results are within five times the highest method blank. The results are qualified with the **UJ** qualifier on the excel data summary that accompanies this report.

In addition to the examination of all QC indicators, the project chemist also verified all of the results by recalculation of values for methods 2540G, 200.8, and 7199. The method of calculation for results from Method 6800 is patented (proprietary) and was unavailable to this validator at the current time. However, the Laboratory is certified to perform this analysis by a number of States and agencies, which would suggest that the results for method 6800 are correct as reported.

No other data have been qualified in any way.

STATEMENT OF DATA USABILITY

Based on the comprehensive data validation process of the data for this project, all results are considered confident as reported and usable for the intended use of the data, with the exception of the three results considered undetected as discussed above.

It should be noted that the Cr (VI) results generated from method 6800 are up to three times greater than the results generated from method 7199. It is the position of the EPA and other agencies that data generated from method 6800 is very reliable and is the preferred method for determining the speciation of transition metals such as Chromium. Based on this statement, it is recommended that the data user be advised to utilize the results from EPA method 6800 for this project.

Report prepared by: Roy J. Cohen, PhD on: November 16, 2015

Project Chemist, North Wind.

INTRODUCTION

This report discusses the data validation of a Level IV data package generated by Brooks Applied Labs located at 18804 North Creek Parkway, Suite 100, Bothell, Washington 98011. The data package was received on November 16, 2015. The data validator performed a Level IV data validation examination, as per EPA and DoD-DOE QSM requirements. The type of validation process involves a comprehensive examination of every facet of the analyses represented by and documented in the data package. This report will provide details of this process and will discuss the quality of the data and any effects the data quality have on the reported results. A data summary spreadsheet will also be provided to enable the user to easily view all the data and data qualifiers applied as a result of the data validation process.

SUMMARY OF PROJECT

This project entailed the sampling of six (6) soil samples for the analysis of Chromium. In particular, the samples were analyzed for Total Chromium, Hexavalent Chromium (Cr VI), and Total Solids (in order to provide a correction factor so that results could be reported on a "dry weight" basis). Several methods for sample analysis were utilized by the laboratory, which are discussed in the next section.

SUMMARY OF METHODS

Three methods were used to determine Chromium concentrations in the six samples submitted for analysis. The following is a brief explanation of these methods and why three methods were utilized.

EPA method 200.8: ICP-MS (Inductively Coupled Plasma triple quadrupole- Mass Spectroscopy) analysis for Total Chromium

This method is used to determine the presence of and concentrations of over 60 metal elements in a wide variety of samples. In this method, samples are digested and then introduced into a radio frequency plasma, where the analytes are desolved, atomized and ionized. The ions so produced are transferred from the plasma to a triple quadrupole (QQQ) filter and the ions of interest are then transferred to a triple quadrupole filter, which filters target masses, then these mass ions are transferred to a mass analyzer, which detects and quantifies the metal analytes of interest. The resulting signal is then converted to usable data via a data handling system. The results labeled "Cr" were generated in this manner.

EPA Method 7199: ICP-DRC-MS (ICP - plasma dynamic reaction cell - MS) for Hexavalent Chromium (Cr VI)

This method involved all the capabilities of method 200.8, with added sample preparation steps. These added steps include passing the digestates of samples through an ion-exchange column, which is followed by adjustment of the pH to greater than 7. This mobilizes the chromium ions (one of which is Cr VI), which is then passed through a DRC chamber which preferentially reacts with Cr VI. The signal is then collected and results for Cr (VI) are generated via the data handling system.

EPA Method 6800: IC-ICP-DRC-MS

This method is similar to the 7199 method, with an important difference. For method 6800, various isotopes of Chromium are detected, which gives rise to the acronym used for this method: SIDMS (Speciated isotope dilution MS). This method of analysis is essentially free from interferences and can determine specific species of Chromium by the use of labeled isotopes of Chromium (Cr-50, Cr-52 and Cr-53) for each species (oxidation state), which are detected by their individual retention times. This method works even if the Cr (VI) has degraded to Cr (III) during the sample preparation or analysis. Proponents of this method claim that it is the most reliable method for determining specific oxidation states of metal ions in a variety of matrices.

The total chromium value is the sum of the Cr (III) and Cr (VI) results. Once one knows the Total Chromium (Cr (III) + Cr (VI)) value, and when the Cr (VI) concentration is determined, the Cr (III) can be calculated by difference. In most cases, Cr (III) makes up a large component of the total chromium result, as can be seen in the data presented for this project. Cr (VI) is environmentally and toxicologically important, which is the reason for the analysis.

Standard method 2540G: Total Solids

This is a simple method for determining percent solids of a solid sample. A known mass of sample is dried in an oven for a period of time, and the loss of mass is attributed to water that has been driven off. The dry mass divided by the original mass is calculated and a percent solids value is derived from that result. The initial ("wet") concentration result for an analyte is then divided by the percent solids value to obtain the "dry weight" result.

SPECIFIC DATA PACKAGE INFORMATION

The data package received by the project chemist is 332 pages in length. It is divided into several main sections:

- Introduction and overview
- Sample results and analytical batch information
- QC summary (accuracy and precision)
- Calibration information
- Chain of Custody and sample container summary
- Raw analytical data for four (4)sample analysis batches

All necessary data were present and complied with the detail and completeness required for a Level IV data package. The Project chemist was able to utilize all the contents of the data package in order to perform the level IV data validation process. In addition, the thorough examination of the data deliverables also serves as the Data Verification activity (also known as Contract Compliance Screening, CCS, by some entities).

Sample IDs

The following six samples were submitted for analysis: All sample numbers are preceded by **DAAB**

4882D-048 4882D-049 4882D-050FD 4882D-051 4882D-052 4882D-053

Sample Collection and Receipt

They were all collected on October 8, 2015. All samples were received by the laboratory on October 9, 2015 in good condition.

QC SUMMARY

QC Indicators

The following QC indicators were employed for these analyses:

- Method blank (MBLK)
- Calibration verification standards (ICV, CCV)
- Matrix spike analysis (MS)
- Matrix Spike Duplicate analyses (MSD)
- Laboratory control samples: Certified reference materials (CRMs) and Standard Reference materials (SRMs), Laboratory fortified Blanks
- Laboratory duplicates (DUP)
- Field Replicate sample analyses

QC results

Each of the above QC indicator results were examine to determine if (a) there were unacceptable results and (b) if so, what effects these unacceptable results would have on the results. "Unacceptable" means that the blank values, MS/MSD % recoveries, laboratory duplicate precision (RPD), SRM and CRM % recoveries are outside of acceptable limits.

The following is the summary of Laboratory QC indicator performance:

- Method blank (MBLK): The Method 7199 Method blanks produced results that are greater than the method detection limits (MDLs). A maximum value of 0.010 mg/kg was obtained. The method 6800 Method blanks also produced results that exceeded the MDLs. A maximum value of 0.023 mg/kg was obtained. Neither blank value has any impact on actual sample results; all sample results were at least 7.5 times these blank values. (All but one result from method 6800 and all the results from method 7199 were at least **10 times** the blank value.) All other blanks for the other methods were acceptable.
- Calibration verification standards (ICV, CCV): All ICV and CCV recoveries were within acceptable ranges of 90-110%.
- Matrix spike analysis (MS): all MS recoveries were within acceptable ranges of 80-120%.
- Matrix Spike Duplicate analyses (MSD): All MSD recoveries were within acceptable ranges of 80-120%.
- Laboratory control samples: (Certified reference materials (CRMs) and Standard Reference materials (SRMs), Laboratory fortified Blanks): All SRM, CRM and Lab fortified blank recoveries were within the acceptable range of 80-120%.
- Laboratory duplicates (DUP): Laboratory duplicate relative percent difference (RPD) values were less than 38%, which is considered acceptable for solid matrix result precision.
- In addition, the samplers collected a field replicate (duplicate) sample, designated as DAAB4882D-050FD, which is the replicate of sample DAAB4882D-049. Duplicate precision is measured by the Relative Percent Difference (RPD) between the pairs of results from the replicate samples. The relative percent difference values were calculated for each analysis performed on the two samples, with the following results:

Total Solids (method 2540G): 0.27 % RPD

Total Chromium (method 200.8): 3.13 % RPD

Cr (VI) (method 7199): 5.41 % RPD

Cr (VI) (Method 6800): 9.58 % RPD

Qualified results based on QC results

Based on the foregoing QC result summary, ***ALL results are considered confident***. No results are qualified in any way. The RPD calculations from the field replicate analyses affirm the reliability of the overall accuracy of the analyses. For soils, the acceptable precision criterion is < 40% RPD. All result pairs easily met this criterion; in fact, easily exceeded the criterion (in a favorable direction - all much less than 40% RPD).

In addition to the examination of all QC indicators, the project chemist also verified all of the results by recalculation of values for methods 2540G, 200.8, and 7199. The method of calculation for results from Method 6800 is patented (proprietary) and was unavailable to this validator at the current time. However, the Laboratory is certified to perform this analysis by a number of States and agencies, which would suggest that the results for method 6800 are correct as reported.

No other data have been qualified in any way.

STATEMENT OF DATA USABILITY

Based on the comprehensive data validation process of the data for this project, all results are considered confident as reported and usable for the intended use of the data. No data are considered compromised or estimated for any reason.

It should be noted that four out of six of the Cr (VI) results generated from method 6800 are up to two times greater than the results generated from method 7199. It is the position of the EPA and other agencies that data generated from method 6800 is very reliable and is the preferred method for determining the speciation of transition metals such as Chromium. Based on this statement, it is recommended that the data user be advised to utilize the results from EPA method 6800 for this project.

MEMORANDUM

SUBJECT: Hexavalent Chromium Soil Analysis
Data Review and Comments
Laboratory Project IDs: N15I011 & 1541071.

FROM: Jeff Wilmoth, Chemist
Office of Quality Assurance
Science and Ecosystem Support Division

THRU: Denise Goddard, Chemist
Office of Quality Assurance
Science and Ecosystem Support Division

TO: Ray Terhune, Chemist
Office of Quality Assurance
Science and Ecosystem Support Division

This memorandum was prepared to provide a summary of the data review findings for the hexavalent chromium analytical data submitted to Region 4 on December 7, 2015, by Brooks Applied Laboratory of Bothell, Washington. As noted below, the soil samples were collected on August 31, 2015 and October 19, 2015, from various locations at the Savannah River Nuclear Site and analyzed using Method 7199. These data sets were originally validated by North Wind, Inc. of Greenville, South Carolina.

Sample Receiving

1) Eleven soil samples were collected on 8/31/15, prepared on 9/9/15 and analyzed on 9/10/15. The second set of six soil samples were collected on 10/8/15, prepared on 10/19/15 and analyzed on 10/21/15. In both cases, the laboratory met the applicable sample preparation and analytical holding times.

2) Soil samples were submitted using one sample entry per Chain of Custody (COC) page. This resulted in seventeen (17) pages of COCs submitted for 17 samples. No explanation was provided in the validation report for using separate COCs for each soil sample. Chain of custodies can accommodate multiple sample entries. Recommend samplers utilize available space on the COCs to reduce the number of COCs needed.

Calibration

N15I011

1) In the initial calibration (ICAL), 150909, the Blank and lowest level standard (0.01 ppb) were analyzed four (4) times. The average peak areas of these four analyses were used as the Blank and 0.010 ppb level entries for the ICAL. Averaging multiple calibration results for ICAL entry is not considered good laboratory practice. All Standards should be evaluated the same.

1541071

2) In the initial calibration (ICAL), 1500790, the Blank and lowest level standard (0.01 ppb) was analyzed four (4) times. The average peak areas of these four analysis were used as the Blank and 0.010 ppb level entries for the ICAL. Averaging multiple calibration results for ICAL entry is not considered good laboratory practice. All Standards should be evaluated the same.

The original data validator did not note this issue on their validation reports.

Traceability of Standards

1) Wording standards could not be traced to their original source.

Calculations

N15I011

1) Sample results for Sample 4882DAB-21 (Lab ID: NC15I011-01) were re-calculated.

$$\frac{50.5\text{mls} * 9.239778\ \mu\text{g/L} \div 0.8987(\%\ \text{solid})}{2.4927\text{g} * 1000} = .20828\ \text{mg/kg}$$

Re-calculated results match what was reported for this sample.

2) Results for Laboratory Fortified Blank (Lab ID: NC00054-BS2) were re-calculated

$$\frac{50.5\text{mls} * 1151.6\ \mu\text{g/L}}{2.5\text{g} * 1000} = 23.262\ \text{mg/kg}$$

Re-calculated results match what was reported.

1541071

1) Sample results for Sample DAAB4882D-048 (Lab ID: 1541071-01) were re-calculated.

$$\frac{50.5\text{mls} * 22.19914\ \mu\text{g/L}}{2.5429\text{g} * 1000} \div 0.8257(\%\ \text{solid}) = 0.5339\ \text{mg/kg}$$

Re-calculated results match what was reported for this sample (0.534mg/kg).

2) Results for Laboratory Fortified Blank (Lab ID: B151675-BS2) were re-calculated

$$\frac{50.5\text{mls} * 923.28\ \mu\text{g/L}}{2.5\text{g} * 1000} = 18.65\ \text{mg/kg}$$

Re-calculated results match what was reported.

Quality Control

N15I011

1) All QC items (LCS, MS/MSD, Duplicates) were within acceptance limits

2) The associated Blanks were all at or below the reported MDL of 0.010 mg/kg.

1541071

1) LCS and MS/MSD recoveries and RPDs were within acceptance limits. The sample duplicate analysis of sample DAAB4882D-049 (DAAB4882D-50FD) resulted in RPD above QC limit of 25. (29%). This was explained in the data validator's case narrative as being attributed to sample matrix non-homogeneity.

2) The associated Blanks were not all at or below the reported MDL of 0.010 mg/kg. However, associated sample results were above 10X the amounts in the blanks, therefore, data was not impacted. NOTE: In this analytical batch, the MDL is listed as 0.002 mg/kg. In the previous submittal from August 2015, the MDL is listed as 0.010 mg/kg. The MRLs in both cases are listed as 0.020 mg/kg. There was no documentation provided explaining the 5X decrease in the MDL in this data set.

Observations

1) The standard preparation logs were not submitted as part of the data package available for this review. Confirmation of SRMs and other Spike standard concentrations could not be assessed.

Conclusion

Based on the information available from the data package submitted for oversight review, the data appears to be suitable for its intended use. However, the issue noted with the initial calibration (averaging the peak areas of the lowest calibration standard) does warrant concern regarding laboratory practices. Although this may not have a direct impact on data quality in this case, this practice can have the appearance of manipulating calibration data and could result in misleading calibration recoveries and acceptance.

If you have any questions concerning these comments, please contact Denise Goddard at (706) 355-8568 or at Goddard.denise@epa.gov.

RE: Memorandum dated February 29, 2016

Dr. Goddard,

This document has been prepared in response to the USEPA's memorandum concerning hexavalent chromium data generated by Brooks Applied Labs (BAL) for North Wind, Inc. and issued in Reports N15I011 and 1541071. Brooks Applied Labs is devoted to continually improving the quality of our methods and systems, and therefore welcomes the comments provided to us on behalf of the USEPA.

BAL's standard practice for calibration for hexavalent chromium by ion chromatography inductively coupled plasma dynamic reaction cell mass spectrometry (IC-ICP-DRC-MS) is to analyze a minimum of five standards spanning the linear range of the instrument. For this method, the concentrations of the calibration curve typically span three orders of magnitude. Four replicates of the lowest calibration standard are analyzed, and the average response of the four replicates is used in the calibration. These four replicates are analyzed to allow calculation of a sequence-specific method detection limit (MDL) that more accurately reflects the run-to-run variability of the analyses compared to a traditional yearly MDL study performed in compliance with 40 CFR 136, Appendix B. Finally, the calibration curve itself is generated using an unweighted linear regression forced through zero.

In the sections of the USEPA memorandum entitled *Calibration* and *Conclusion*, it was noted that averaging multiple calibration results is not good laboratory practice. While BAL agrees that such a practice would be inappropriate in certain circumstances, averaging the response of the lowest calibration standard in a multi-point calibration spanning three orders of magnitude has no significant impact on the obtained calibration or sample results. For example, when the calibration applied to Sequence 1500790 for Report 1541071 was changed to include any or all individual response(s) of the replicates of the lowest calibration standard, the calibration slope and calculated sample results changed by less than 0.00001%. Despite the negligible effect of this change, BAL may consider modifying its current calibration procedures for this method. In the meantime, upon client request BAL can instead include in the calibration the individual response of each of the replicates of the lowest calibration standard.

In the sections of the USEPA memorandum entitled *Traceability of Standards* and *Observations* it was noted that the standard preparation logs were absent from the data package, preventing data validators from independently confirming the concentrations of all spiked batch and sequence quality control samples. BAL does document the preparation of all spiked samples, but typically only provides this documentation upon client request. An example of this documentation for the hexavalent chromium results associated with Report 1541071 has been provided in Appendix A of this response. Future Level IV reports for this project can include these standard preparation logs if requested by North Wind Inc.

In the section of the USEPA memorandum entitled *Quality Control*, it was noted that there was no documentation explaining why the MDL for hexavalent chromium for Report 1541071 was 0.002 mg/kg whereas that for Report N15I011 was 0.010 mg/kg. In the *Analytical Issues and Discussion* section of each of these reports, it is briefly mentioned that the MDLs for hexavalent chromium are calculated as three times the standard deviation of the replicate analyses of the lowest standard in the calibration curve. As previously noted in this response, BAL has historically calculated sequence-specific MDLs using these replicates since it has been BAL's stance that such calculations more accurately reflect the variability near the method reporting limit (MRL) for a specific analytical run. Upon client request BAL can instead report results for hexavalent chromium using the most recent MDL study conducted in accordance with 40 CFR 136, Appendix B.

Brooks Applied Labs again appreciates the data review performed by the USEPA Region 4 staff. Any further questions or concerns may be addressed to Ben Wozniak at (206) 753-6158 or ben@brooksapplied.com.

Sincerely,

Ben Wozniak

Ben Wozniak

Certificate of Analysis

Std-01-33-10

Product Description:

Name:	Chromium^{+6}	Source Material:	Potassium Dichromate
Part Number:	**100012-7**	Material Purity:	99.993%
Lot Number:	**1312101**	Matrix:	H_2O

Certified Value: 1000 µg/mL ± 5 µg/mL

The Certified value is based on gravimetric preparation and verified using an internal laboratory-developed method. The uncertainty in the certified value is calculated for a 95% confidence interval.

Density: 1.000 g/mL ± 0.002 g/mL @ 23.9°C

Preparation Information:

The highest purity source materials were purchased from qualified vendors per ISO 9001:2008 guidelines. This standard was prepared using methods developed at National Institute of Standards and Technology (NIST) for the preparation of SRM Spectrometric Standard Solutions. The matrix is 18 megaohm deionized water.

Traceability Information:

The traceability of this standard is maintained through an unbroken chain of comparisons to appropriate standards with suitable procedure and measurement uncertainties. The maintenance of the base and derived units of International System of Units (SI) with traceability of measurement results (contemporary metrology) to SI ensures their comparability over time as follows.

a. **Standard Weight and Analytical Balance**
The standard weights (NBS weights Inventory No 20231A) are calibrated every two years by South Carolina Metrology Laboratory that is a participant in "NIST Weights and Measures Measurement Assurance Program" with a certificate of measurement traceability to NIST primary standards.
The balances are calibrated yearly by the ISO 17025 accredited metrology service, and are verified weekly by an in-house method using standard weights.

b. **Volumetric Device**
The calibration of volumetric vessels is checked annually using the NBS 602 method.

c. **Thermometer**
The standard thermometers are calibrated every year by the ISO 17025 accredited metrology service. The thermometers used in-house are verified against the standard thermometers yearly.

Packaging and Storage Conditions:

The standard is packaged in a pre-cleaned polyethylene bottle. To maintain the integrity of this product, the solution should be kept tightly capped and stored under normal laboratory conditions.

Refer to Material Safety Datasheet (MSDS) for hazardous information.

Expiration Information:

The expiry date is guaranteed to be valid for eighteen months from the shipping date provided. For this reason, standards from the same lot may have different expiration dates.

Preparation Date:	May 1, 2013
Shipped Date:	10/3/2014
Expiration Date:	4/3/2016
Certificate Issue Date:	May 2, 2013

Certificate of Analysis

Standard Reference Material® 2701

Hexavalent Chromium in Contaminated Soil (High Level)

This Standard Reference Material (SRM) is intended primarily for use in the analysis of waste, soils, sediments, or other materials of a similar matrix. SRM 2701 is a soil, heavily contaminated with chromite ore processing residue (COPR), which has been air-dried, sieved, radiation-sterilized, and blended to achieve a high degree of homogeneity. All constituents in SRM 2701 for which certified, reference, and information values are provided were naturally present in the material before processing. A unit of SRM 2701 consists of approximately 75 g of the dried, radiation-sterilized material in an amber screw-capped glass bottle.

Certified Values: The certified concentrations of hexavalent chromium, total chromium, iron, and manganese in SRM 2701 are given in Table 1. A NIST certified value is a value for which NIST has the highest confidence in its accuracy in that all known or suspected sources of bias have been investigated or taken into account [1]. The certified values are based on the agreement of results from two or more independent analytical methods. The certified value for hexavalent chromium is the unweighted mean of analytical measurements by NIST and three collaborating laboratories. The value is based on the extraction of hexavalent chromium from the material using an approved U.S. Environmental Protection Agency (EPA) SW-846 analytical method (Method 3060A), which was used by all participating laboratories. The certified values for total chromium and iron are the unweighted means of results from three independent analytical methods at NIST. The certified value for manganese is the unweighted mean of results from two independent analytical methods at NIST.

Reference Values: Reference concentration values for aluminum, calcium, magnesium, potassium, sodium, silicon, titanium, and vanadium are provided in Table 2. Reference values are non-certified values that are the best estimate of the true value; however, the values do not meet NIST criteria for certification and are provided with associated uncertainties that may reflect only measurement precision, may not include all sources of uncertainty, or may reflect a lack of sufficient statistical agreement among multiple analytical methods [1]. The reference values are based on the results of measurements from a single method performed at NIST.

Information Values: Information values for sulfide, total organic carbon (TOC), chemical oxygen demand (COD), pH, and oxidation/reduction potential are provided in Table 3 as additional information on the composition and properties of the material. An information value is considered to be a value that will be of interest and use to the SRM user, but for which insufficient information is available to assess adequately the uncertainty associated with the value, or only a limited number of analyses were performed [1]. The information values are based on measurements from a single collaborating laboratory.

Expiration of Certification: The certification of **SRM 2701** is valid, within the measurement uncertainty specified, until **31 December 2018**, provided the SRM is handled and stored in accordance with instructions given in this certificate (see "Instructions for Use"). The certification is nullified if the SRM is damaged, contaminated, or otherwise modified.

Maintenance of SRM Certification: NIST will monitor this SRM over the period of its certification. If substantive technical changes occur that affect the certification before the expiration of this certificate, NIST will notify the purchaser. Registration (see attached sheet) will facilitate notification.

Coordination of the technical measurements leading to the certification of SRM 2701 was provided by S.E. Long of the NIST Chemical Sciences Division.

Office of Reference Materials

SRM 2701

Analytical measurements at NIST were performed by W.C Davis, W.R. Kelly, S.E. Long, J.L. Mann, A.F. Marlow, K.E. Murphy, R.L. Paul, J.R. Sieber, R.O. Spatz, and R.L. Zeisler of the NIST Chemical Sciences Division.

Measurements for the certification of hexavalent chromium were provided by the following collaborating laboratories: H.M. Kingston of Duquesne University (Pittsburgh, PA), D. Dunlop of TestAmerica (Pittsburgh, PA), and R. Gerads of Applied Speciation and Consulting LLC (Tukwilla, WA). Information values are based on data supplied by C. Armbruster of TestAmerica (Edison, NJ).

A multi-laboratory test on the usage of EPA SW-846 methods for hexavalent chromium, leachable chromium, and total chromium in SRM 2701 was conducted by NIST and NJDEP. The results of the study are summarized in Appendix A.

The material was collected by S.E. Long of the NIST Analytical Chemistry Division and B.S. MacDonald of the Office of Reference Materials in collaboration with S.J. Nagourney of the New Jersey Department of Environmental Protection (NJDEP), Office of Quality Assurance (OQA).

Statistical consultation was provided by Z.Q.J. Lu of the NIST Statistical Engineering Division.

Support aspects involved in the issuance of this SRM were coordinated through the NIST Office of Reference Materials.

NOTICE AND WARNINGS TO USERS[1]

Storage: SRM 2701 must be stored in its original bottle, tightly capped, at temperatures less than 30 °C and away from light.

Handling: This material is a contaminated soil that contains a significant amount of hexavalent chromium. HEXAVALENT CHROMIUM IS A KNOWN CARCINOGEN. Due caution and care should be exercised during its handling and use. This material has been processed to maintain homogeneity and is composed of a particle size distribution that is readily respirable. Stringent precautions should be taken to avoid inhalation of dust during material transfer and in the event of bottle breakage or compromise of the lid seal.

INSTRUCTIONS FOR USE

Use: A minimum sample mass of 200 mg (dry mass – see "Instructions for Drying") should be used for analytical determinations to be related to the certified values on this Certificate of Analysis. Prior to use, the contents of the bottle should be thoroughly mixed by gently rotating the bottle by hand and inverting several times. As this process may generate electrostatic charges, caution should be exercised when opening the bottle to avoid accidental exposure to the contents.

Instructions for Drying: Samples should be dried for 2 h at 110 °C in a laboratory convection oven to obtain a correction factor for moisture. Correction for moisture is to be made to the data before comparison with the certified values. The approximate mass loss on drying has been found to be in the range of 1.9 % to 2.3 % (n = 6), with a mean of 1.93 %.

Source and Preparation of Material: The material was processed by S.A. Wilson of the United States Geological Survey (USGS) under contract to NIST. The source material was chromite ore-contaminated soil from a location in Hudson County, New Jersey. Material was acquired from a three-acre site behind the Interpretative Center at the Liberty Science Center in Liberty State Park, Jersey City, NJ. By means of a mechanical excavator, samples of soil were collected in metal drums fitted with polyethylene liners to prevent contact between the material and the surface of the drums. The drums were then sealed and shipped to USGS (Lakewood, CO) for processing. At USGS, the soil was removed from the drums, transferred onto plastic-lined cardboard trays, and dried in a forced-air oven operating at room temperature for three days. Once dry, the material was transferred into a series of plastic-lined, five-gallon buckets. The material was then mechanically disaggregated using a ceramic auger and grinding bowl. The oversized material was separated from the soil fraction by sieving through a vibrating 2 mm screen. The fraction that was less than 2 mm was then ground in 25 kg batches using a ceramic-lined ball mill and corundum grinding media for a period of 8 h. The ground material was transferred to a series of five-gallon containers and

[1] Certain commercial equipment, instruments or materials are identified in this certificate to adequately specify the experimental procedure. Such identification does not imply recommendation or endorsement by the National Institute of Standards and Technology, nor does it imply that the materials or equipment identified are necessarily the best available for the purpose.

sealed prior to gamma radiation sterilization at an average dosage rate of 39.1 kGy per container. Upon return to USGS, the material was transferred to a 10 ft^3 cross-flow V-blender and allowed to mix for 24 h. The blended material was then finally split into 4 oz. brown glass screw-capped bottles using a custom-designed spinning riffler.

Analytical Methods: The analytical methods used for determination of certified and reference values in SRM 2701 are listed in Table 4.

Homogeneity: The homogeneity of SRM 2701 was assessed by analyzing duplicate samples from 20 bottles selected by stratified random sampling. The material was pressed into briquettes and analyzed by wavelength-dispersive X-ray fluorescence spectrometry using 20 selected elements as indicators. The data were subjected to analysis of variance (ANOVA) testing. The findings for between-bottle heterogeneity indicated that, at the 95 % confidence level, none of the bottles' contents exhibited statistically significant differences from the rest of the population of the sampled bottles with the exception of the copper content. For chromium, the relative standard deviation (RSD) of the measurements was less than 1 % for an estimated sample size of 170 mg. Results for all elements listed in Table 2 also had RSDs of less than 1 %, with the exception of sodium, which had an RSD of 1.9 % for an estimated sample size of 3 mg.

Table 1. Certified Values for Concentrations of Hexavalent Chromium and Selected Elements

	Mass Fraction [a]				
Hexavalent Cr[b]	551.2	mg/kg	±	34.5	mg/kg
Total Cr	4.26	%	±	0.12	%
Fe	23.73	%	±	0.19	%
Mn	0.2137	%	±	0.0014	%

[a] Each certified concentration value, expressed as a mass fraction on a dry-mass basis, is an equally weighted mean of the individual sets of results. The uncertainty in the certified value, calculated according to the method described in the ISO/JCGM Guide [2], is expressed as an expanded uncertainty, U. The expanded uncertainty is calculated as $U = ku_c$, where u_c is intended to represent, at the level of one standard deviation, the combined effects of inherent sources of uncertainty of the measurements and corrections for interferences and species interconversions (hexavalent chromium). The value of the coverage factor, $k = 2$, corresponds to a level of confidence of approximately 95 %.
[b] As determined after extraction using EPA Method 3060A.

Table 2. Reference Values for Concentrations of Selected Elements

Element	Mass Fraction, % [a]			Element	Mass Fraction, % [a]		
Al	5.05	±	0.15	Na	0.255	±	0.005
Ca	7.47	±	0.09	Si	4.17	±	0.04
K	0.174	±	0.007	Ti	0.547	±	0.008
Mg	7.47	±	0.17	V	0.236	±	0.011

[a] Each reference concentration value, expressed as a mass fraction on a dry-mass basis, is an equally weighted mean of the individual sets of results. The uncertainty in the reference value, calculated according to the method described in the ISO/JCGM Guide [2], is expressed as an expanded uncertainty, U. The expanded uncertainty is calculated as $U = ku_c$, where u_c is intended to represent, at the level of one standard deviation, the combined effects of inherent sources of uncertainty of the measurements and corrections for interferences. The value of the coverage factor, $k = 2$, corresponds to a level of confidence of approximately 95 %.

Table 3. Information Values for Selected Species and Properties

Species/Property	Value	Unit
Chemical oxygen demand (COD)	<10	mg/kg
Redox potential	526	mV
Sulfide	<10	mg/kg
Total organic carbon (TOC)	36900	mg/kg
pH	9.6

Users of this SRM should ensure that the Certificate of Analysis in their possession is current. This can be accomplished by contacting the SRM Program: telephone (301) 975-2200; fax (301) 948-3730; e-mail srminfo@nist.gov; or via the Internet at http://www.nist.gov/srm.

APPENDIX A

Multi-Laboratory Testing Using Approved U.S. Environmental Protection Agency (EPA) Analytical Methods: Method 3060A, Method 7196A, Method 7199, and Method 6800 (Hexavalent Chromium), Method 3050 (Leachable Chromium), and Method 3052 (Total Chromium)

The certified values of inorganic constituents in most National Institute of Standards and Technology (NIST) chemical composition Standard Reference Materials (SRMs) reflect the total absolute concentration of each measurand in the given SRM matrix. The certified concentrations are based on rigorous measurements obtained by well-characterized primary methods, or two or more independent methods or techniques. If dissolution of the matrix is necessary, the measurement approach generally requires complete sample decomposition, which can usually be achieved in a high-pressure digestion system such as a Carius tube. Alternatively and where applicable, the sample may also be analyzed nondestructively.

For environmental monitoring purposes, the concentrations of labile or extractable fractions of elements are often more useful than total concentrations. Concentrations of labile or extractable fractions are generally determined using relatively mild leach conditions, which are unlikely to totally decompose the sample. Reported concentrations of labile or extractable fractions of elements are generally lower than total absolute concentrations; recovery can be total only if an element in a given sample is completely labile. The recovery of an element as a percentage of the total concentration is a function of several factors that are defined by the sample matrix and the measurement method conditions.

In its monitoring programs, the U.S. EPA has promulgated a number of analytical methods to determine toxic elements, or element species, in soils, sediments, and sludges. The EPA publication SW-846, *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods* [3], is the official compendium of analytical and sampling methods compiled by the EPA Office of Solid Waste (OSW). The methods have been evaluated and approved for use in accordance with the 1976 Resource Conservation and Recovery Act (RCRA). SW-846 Methods 3060A, 7196A, 7199, and 6800 are applicable to the measurement of hexavalent chromium, while Methods 3050 and 3052 are applicable to measurements of leachable chromium and total chromium respectively. Method 3060A is currently the best available analytical method for the extraction of hexavalent chromium from solid matrices and preservation of the oxidation state prior to analytical determinations using other finishing methods such as 7196A (colorimetric), 7199 (ion chromatography with post-column derivatization), and 6800 (elemental and speciated isotope dilution mass spectrometry). Method 3060A was used as the common basis for the certified value of hexavalent chromium in SRM 2701. Method 3050 is a strong acid leachable digestion method intended for the dissolution of elements that are environmentally available, while Method 3052 employs microwave-assisted digestion of solid samples, which is intended to provide almost complete decomposition of the sample, including silica, primarily using concentrated nitric acid and hydrofluoric acid combined with microwave heating.

To assess the performance of these SW-846 methods for the determination of hexavalent chromium, leachable chromium, and total chromium in SRM 2701 and to provide data that are relevant to users of these SW-846 methods, a multi-laboratory test was organized jointly by NIST and the New Jersey Department of Environmental Protection (NJDEP), Office of Quality Assurance (OQA) involving 22 participating laboratories listed in Table A1. Stratified random samples of SRM 2701 were distributed to a number of collaborating laboratories who were asked to measure the hexavalent chromium, leachable chromium, and/or total chromium concentrations in the material. Several laboratories provided replicate analyses for each data set from which the mean was calculated. The means of all the data sets forwarded by each laboratory are compiled by method in Table A2 and include summary statistics together with the percent recovery relative to the certified value.

Please note that none of the values in Table A2 are certified; these values are provided as information on the typical relative performance of the various EPA SW-846 methods for the determination of hexavalent chromium and total chromium in SRM 2701. The data should not be used for any other purpose. **The certified values, provided in Table 1 of the Certificate of Analysis, are the best estimates of the true concentrations.**
