1.0 GENERAL DESCRIPTION

1.1 Purpose and Scope

This Removal Action Report (RAR) documents the completion of field implementation of the removal actions for the D-Area Operable Unit (DAOU) 488-2D Ash Basin and 488-4D Ash Landfill. The DAOU is listed as a Resource Conservation Recovery Act (RCRA)/ Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) unit in Appendix C of the Federal Facility Agreement (FFA) (FFA 1993) for the Savannah River Site (SRS). The 488-2D Ash Basin and 488-4D Ash Landfill, in addition to the D-Area 488-1D Ash Basin and 489-D Coal Pile Runoff Basin (CPRB) are subunits of the DAOU located at the SRS, in Aiken, South Carolina. This report summarizes the activities performed to implement the selected removal actions requirements defined in the *Removal Action Design Plan (RADP)* (SRNS 2014a). In addition, this report serves as the closeout report for both the 488-4D Solid Waste Landfill Permit #025800-1602 and the closure of the Ash Basin Industrial Wastewater Treatment (IWT) Permit #7295 as applied to the 488-2D facility.

The removal actions along with the Applicable or Relevant and Appropriate Requirements (ARARs) were established in the *RSER for the D-Area Ash Basin (488-2D Ash Basin)* (SRNS 2014b), the *Removal Site Evaluation Report/Engineering Evaluation/Cost Analysis (RSER/EE/CA) for the D-Area Ash Landfill 488-4D* (SRNS 2014c) and the Action Memorandums (United States Department of Energy [USDOE] 2014a and USDOE 2014b) for each removal action. The groundwater monitoring requirements, proposed new well locations, well specifications, and sampling requirements defined by the D-Area Groundwater Operable Unit (OU); however, the abandonment and installation of the wells were installed as part of this closure project.

The scope of this report includes the following items:

- A brief description of the 488-2D Ash Basin and 488-4D Ash Landfill background, including early action requirements and objectives,

- A chronology of completed events related to the removal action of the 488-2D Ash Basin and 488-4D Ash Landfill,
- A summary of construction/removal activities performed,
- Deviations from the original design/requirements of the approved *RADP* (SRNS 2014a),
- Performance standards and quality control inspections, including a summary of performance test results documenting verification of compliance with the acceptance criteria in the *RADP* (SRNS 2014a),
- Final inspection and verification of construction/removal completion,
- Figures including field photographs,
- As-built drawings,
- Forecasts of post-construction activities (e.g., operation and maintenance), and
- Project costs.

1.1.1 Document Format

This RAR was prepared in accordance with the requirements for submittal of regulatory documents identified in the FFA (FFA 1993) between the USDOE, U.S. Environmental Protection Agency (USEPA), and South Carolina Department of Health and Environmental Control (SCDHEC). The format of this RAR was based on the Post-Construction Report protocol format found in the *Environmental Compliance and Area Completion Projects Regulatory Document Handbook* (SRNS 2014d) approved by the USEPA and SCDHEC as applicable to the RAR.

1.2 General Description and History of the Unit

SRS occupies 801.5 square kilometers (km^2) (309.4 square miles [mi^2]) of land adjacent to the Savannah River, principally in Aiken and Barnwell counties in South Carolina. SRS is located approximately (~) 40.2-km (25-mi) southeast of Augusta, Georgia, and 32.1-km (20-mi) south of Aiken, South Carolina (Figure 1). D Area is located in the southwest quadrant of the SRS, ~914-meters (m) (3,000-feet [ft]) east of the nearest site boundary the Savannah River (Figure 2).

SRS reactors that were used to produce nuclear materials required heavy water as a moderator. The heavy water was produced at D Area. D Area also contained the heavy water rework facility

to purify the SRS inventory of used reactor moderator. Like most of the industrial areas located at the Site, D Area was self-sustaining with needed utilities, administration, industrial and medical facilities located within the Area. An inactive coal fired powerhouse is also located in D Area.

The D-Area Powerhouse was built in 1953 and removed from service in 2012 after 59 years of operation. During its years of operation, the facility burned ~160,000 tons of coal per year. The 488-D Ash Basin, 488-1D Ash Basin, 488-2D Ash Basin, 488-4D Ash Landfill, and the 489-D CPRB were constructed in support of powerhouse operations in D Area (Photos 1 and 2). Following the powerhouse shutdown, continued operations of the ash basins, ash landfill and coal pile runoff basin were no longer required. Deactivation of the D-Area Powerhouse and associated facilities began in 2012. Photo 3 provides a preconstruction view of the area.

Previous remedial and removal activities associated with D Area ash facilities have occurred. In 2007, the 488-D Ash Basin was closed under a CERCLA remedial action. A non-time critical removal (NTCR) action was completed on the northern 25% of the 489-D CPRB in 2011. In 2011, the USDOE, USEPA, and SCDHEC agreed to add the 488-1D Ash Basin, 488-2D Ash Basin, and the 488-4D Ash Landfill to the FFA for final closure under CERCLA. The 488-4D Ash Landfill is currently permitted as a Class 2 Solid Waste Landfill (SC Solid Waste Landfill Permit #025800-1602). The 488-1D Ash Basin, 488-2D Ash Basin and 489-D CPRB are currently SCDHEC IWT permitted facilities (South Carolina [SC] IWT Permit #7295). Negotiations were held with the USEPA and SCDHEC to discuss closure alternatives for the D Area ash facilities. Due to size, complexity, and potential hazards, an alternate closure schedule was developed that supported removal actions for the D Area ash facilities.

Because of the size and duration, the removal action activities were segregated into two distinct Phases. Phase 1 included removal actions at the 488-2D Ash Basin and the 488-4D Ash Landfill. Phase 2 includes the removal actions at the 488-1D Ash Basin and the 489-D CPRB (Figure 3). This report documents the field implementation of the removal actions for Phase 1 (488-4D Ash Landfill and the 488-2D Ash Basin). A separate RAR will be prepared for the Phase 2 (488-1D Ash Basin and 489-D CPRB) removal activities.

Phase 1 removal action activities consolidated ash and contaminated soil from the 488-2D Ash Basin into 488-4D Ash Landfill. Additional consolidation of materials included ash and contaminated soil from outside the western end of the 488-4D Ash Landfill as well as ash from outside the eastern end of 488-2D Ash Basin and surrounding roads identified as Areas 1 and 2 on Figures 3, Figure 4 and Photos 20, 22, 33, and 49. During Phase 1 construction activities, additional ash was found east of the 488-4D Ash Landfill (Area 3) and will be removed as part of Phase 2 construction. A geosynthetic cover, consisting of a 15.2-centimeters (cm) (6-inch [in.]) compacted soil base layer, geosynthetic clay liner (GCL), geosynthetic drainage layer (GDL), a 50.8-cm (20-in.) compacted soil cover layer, 10.2 cm (4 in.) of top soil and sod was placed over the entire 488-4D Ash Landfill. During construction activities, including both Phase I and Phase II, the 488-2D Ash Basin serves as a sedimentation basin. The final end-state of the 488-2D Ash Basin will be a stormwater detention pond.

1.3 Removal Action Requirements and Objectives

1.3.1 Removal Action Objectives 488-4D Ash Landfill

As stated in the *RSER/EE/CA for the D-Area Ash Landfill (488-4D)* (SRNS 2014c), the remedial action objectives (RAOs) for the D-Area Ash Landfill (488-4D) subunit are follows:

- Protect future industrial workers and ecological receptors from exposure to arsenic and coal-related radionuclide contaminants to an exposure risk exceeding 1E-06 (or hazard quotient >1) in surface ash/soil.
- Prevent migration of potential mobile contaminants to groundwater that could exceed groundwater protection standards.

1.3.2 Selected Removal Action 488-4D Ash Landfill

As stated in the *RSER/EE/CA for the D-Area Ash Landfill (488-4D)* (SRNS 2014c) the selected removal action is as follows:

> "A geosynthetic cover system that meets the permeability requirements of the SCDHEC Class Three Landfill regulations will cover the ash. The cover system shall include a GCL with a permeability no greater than $1x10^{-5}$ cm/sec and a functional life of 30 years but will be maintained to have a much longer effective life and have a storm water conveyance

system designed for a 25-year, 24-hour storm event. The cover system will consist of an initial layer of common fill (if necessary), a GCL, a GDL, common fill layer, top soil and vegetation (sod). After construction of the cover system, the final remedial action for the DAOU will institute land use controls (LUCs) to maintain the integrity of the cover system and to prevent unauthorized access until the ash is no longer a threat to human health (HH) and the environment. Current groundwater monitoring and reporting under the D-Area Groundwater OU will continue and will be used to document the effectiveness of the cover system."

"Placement of a cover system compliant with SCDHEC Class Three Landfill permeability requirements provides overall protection to HH and the environment by providing immediate protection to human receptors by preventing direct contact. The geosynthetic cover system also provides assurance regarding the protection of groundwater by reducing infiltration from contact of the contaminated ash media with stormwater. The contaminated ash and other material approved for disposal in the 488-4D Ash Landfill remain in place and LUCs will be required."

Remediation of the 488-4D Ash Landfill by utilization of a NTCR action was an effective strategy for cost-effectively reducing obvious risks, satisfying the closure requirements of the 488-4D Ash Landfill Permit #025800-1602, and accelerating area closure by initiating early actions while meeting necessary ARARs. This alternative does not preclude any additional remediation of the DAOU and is consistent with the current and future land use.

1.3.3 Removal Action Objectives 488-2D Ash Basin

As stated in the *Scoping Summary for D-Area Operable* (SRNS 2014e) the RAOs for the D-Area Ash Basin (488-2D) subunit are as follows:

- Protect future industrial workers and ecological receptors from exposure to contaminants in surface sediment/soils,
- Prevent migration of potential mobile contaminants to groundwater that could exceed groundwater protection standards.

1.3.4 Selected Removal Action 488-2D Ash Basin

The *Removal Site Evaluation Report (RSER) for the D-Area Ash Basin (488-2D)* (SRNS 2014b), addressed the risk from arsenic and naturally-occurring, coal-related radionuclides in ash. The selected action time critical removal (TCR) was ash removal. Although the removal of the water that resided within the 488-2D Ash Basin was not the focus of the TCR action, it was an essential activity that was required before any excavation of ash could take place. The water was removed/managed in accordance with the current National Pollutant Discharge Elimination System (NPDES) Permit (#SC0047431) and/or transferred within the existing IWT permitted basin complex (i.e., 488-1D Ash Basin and associated inlet basins).

The ash in the 488-2D Ash Basin, ash located outside the western end of the 488-4D Ash Landfill, and ash from surrounding roads/berms (Area 1 and Area 2) was removed and placed into the 488-4D Ash Landfill during Phase 1 construction activities. The additional ash found east of 488-4D Ash Landfill (Area 3) will be removed during Phase 2 construction activities for the 488-1D Ash Basin and the 489-D CPRB (Figure 3, Figure 4 and Photos 20, 22, 33, and 49). The 488-4D Ash Landfill was the preferred location depending on capacity (volume) limitations and/or schedule constraints. The ash was not a hazardous waste under the RCRA program. The extent of the removal was based on visual inspection. Confirmation sampling to verify ash removal was performed in accordance with the approved *Confirmation Sampling and Analysis Plan for Coal and/or Ash Removal at the Savannah River Site* (SRNS 2013). A separate site-specific *Field Sampling Plan for the D-Area 488-2D Ash Basin* (SRNS 2014f) was submitted for regulatory review/approval prior to obtaining confirmation samples. The 488-2D Ash Basin confirmation sampling results along with the formal HH and ecological risk evaluations were documented in the *Human Health and Ecological Evaluation for Confirmation Sampling at the 488-2D Ash Basin* (SRNS 2016a) which was submitted and approved by the USEPA and SCDHEC.

1.3.5 Chronology of Events

See **Table 1** for chronology of events.

Table 1. Chronology of Events

Description of Activity	Date
Submittal of the RSER/EE/CA for the D-Area Ash Landfill 488-4D, Rev. 1 (USDOE 2014e)	June 12, 2014
EPA Conditional Approval of the RSER/EE/CA for the D Area Ash Landfill 488-4D (USEPA 2014a)	July 14, 2014
Submitted Action Memorandum and Responsiveness Summary 488-4D (Appendix A) (USDOE 2014a)	August 11, 2014
Removal Action Start 488-4D (Appendix B) (USDOE 2014c)	September 2, 2014
SRNS begins Field Activities as Described Removal Action Start 488-4D	September 2, 2014
Removal Action Start 488-2D (Appendix C) (USDOE 2014d)	October 14, 2014
SRNS begins Field Activities as Described Removal Action Start 488-2D	October 14, 2014
SCDHEC Conditional Approval of the RSER for the D-Area Ash Basin 488-2D (SCDHEC 2014a)	October 14, 2014
EPA Approval of the Action Memo and RSER for the D-Area Ash Basin 488-2D (USEPA 2014b)	October 20, 2014
Submitted Action Memorandum and RSER, Rev. 1, 488-2D (Appendix D) (USDOE 2014b)	October 28, 2014
Contract Award	February 6, 2015
Mobilize to Site	March 23, 2015
Submitted RADP for the 488-4D and 488-2D, Rev. 1.1 (Appendix E) *RADP* (SRNS 2014a)	April 1, 2015
SCDHEC Approval of the RADP for the 488-4D and 488-2D, Rev. 1.1, (SCDHEC 2015a)	April 29, 2015
Start 488-2D Ash Excavation	May 07, 2015
EPA Approval of the RADP for the 488-4D and 488-2D, Rev. 1.1, (USEPA 2015)	May 10, 2015
Complete 488-4D GCL/GDL Installation	July 28, 2016
Mechanical Completion of the 488-4D Ash Landfill	August 31, 2016
Mechanical Completion of the 488-2D Ash Basin	September 22, 2016
"November 2016 Completion Status of the D Area Ash Project", Regulatory Concurrence of 488-4D and 488-2D Completion (Appendix F) (USDOE 2016)	November 3, 2016

2.0 CONSTRUCTION ACTIVITIES

2.1 Construction Team

Savannah River Nuclear Solutions (SRNS) provided project management, oversight, confirmation sampling, including worker protection, and regulatory integration. In addition, SRNS construction forces were responsible for the sluice line removal, initial borrow area land clearing, and access road enhancements. During the construction phase of the project, SRNS Design Engineering provided Title 3 (Construction) support. Envirocon, the prime contractor for implementation of the removal action at the 488-4D Ash Landfill and 488-2D Ash Basin, was responsible for all

remaining construction activities to include contract management, erosion and sediment control measures, stormwater controls, dewatering, excavation, placement and compaction of ash, stormwater conveyance system, subsurface drainage system, placement of common fill, topsoil, crushed stone surfacing, submittals etc. Envirocon used other sub-tier contractors for specific tasks, as they deemed appropriate. The sub-tier contractors included Carolina Sodding Services for the installation of seeding and sodding to include maintenance, and watering; Environmental Specialties International (ESI) for the installation of GCL, and GDL; Trotter Site Preparation for clearing, grubbing, chipping and transportation of root balls to the Three Rivers Landfill; and GEL Engineering for all surveying and as-built needs.

All work described in this section of the RAR was performed in accordance with the *RADP* (SRNS 2014a) associated design drawings, and manufacturer's recommendations. Deviations are discussed in Section 3 "Deviations from Original Design."

2.2 Equipment

Table 2 identifies the general equipment types and activities used during construction.

Table 2. Equipment

General Equipment Type	Type Activity
D-6 and D-8 Dozers (Options Low Ground Pressure [LGP], global positioning system [GPS])	Construction of access roads around the basins, ash placement in 488-4D, grading of existing ash surface in 488-4D, placement of ash, common fill, and topsoil **(Photo 4).**
Excavator 300 and 400 series (Options GPS, Long reach)	Excavation of ash from 488-2D and 488-4D, excavation of borrow material, excavation in support of storm drain system **(Photo 5).**
30-Ton Articulated Haul Trucks	Hauling ash into 488-4D, hauling common fill from borrow area to 488-4D/2D **(Photo 6).**
Tandem Axle Dump Trucks	Hauling materials within the borrow area, supporting clearing and grubbing, hauling of materials to the 3 Rivers Landfill.
Water Trucks	Dust suppression, adding water to fill material to achieve compaction, assisting in watering revegetated areas **(Photo 7).**
Vibratory Compactors Smooth Drum and Sheep's Foot	Compaction of ash, compact common fill, compact crushed stone surfacing. **(Photos 8 and 9).**
Utility Compactor	Walk behind utility trenches, compact materials not accessible to larger equipment **(Photo 10).**
Vibratory Plate Compactor	Compact utility trenches, compact materials not accessible to larger equipment**.**
Backhoes Various Sizes	Excavate utility trenches, backfill utility trenches, construct storm drainage features

Table 2. Equipment *(Continued/End)*

General Equipment Type	Type Activity
Disc and Plough	Turn ash material to assist in drying, incorporate drier ash material with wetter ash material to facilitate compaction.
Loaders w/bucket and forks Various Sizes	Load common fill material into trucks, assist with fill placement and grading, assist with road construction and grading, backfill utility trenches **(Photo 11).**
Motor Grader w/ripper	Maintain site haul roads, assist in conditioning ash, installation of construction access points, and fine grading **(Photos 12 and 13).**
Pickups	General site operations.
Telehandler	Material handling, GCL/GDL deployment.
GPS Base Station and Rover	Assist in grade checking and support machine control.
Pumps Various Sizes	Dewater 488-2D, dewater trenches and sumps.
D-6 and D-8 Dozers (Options LGP, GPS)	Construction of access roads around the basins, Ash placement in 488-4D, grading of existing ash surface in 488-4D, placement of ash, common fill, and topsoil **(Photo 4).**
Track Sod Installer	Installation of sod **(Photo 14).**
Hydroseeder	Hydroseed applications.
All-Terrain Vehicle	General site operations.
Farm Tractors Various Sizes	Spread lime and fertilizer, prep topsoil surface.

Equipment or vehicles that were used for excavation, hauling, and/or compaction of ash were cleaned in areas of the work site to be remediated (i.e., 488-1D Ash Basin). All cleaning water was allowed to runoff into this area.

2.3 Removal Action Activities

Removal action activities were segregated into two distinct Phases. Phase 1 included the 488-2D Ash Basin and the 488-4D Ash Landfill. Phase 2 includes the 488-1D Ash Basin and the 489-D CPRB. The primary objectives of the Phase I (488-2D/488-4D) removal actions was the consolidation of ash from outside the western boundary of the 488-4D Ash Landfill, ash from surrounding roads/berms (Areas 1 and 2), and ash from the 488-2D Ash Basin into the 488-4D Ash Landfill. A geosynthetic SCDHEC Class 3 Solid Waste Landfill cover system was then constructed over the 488-4D Ash Landfill. The major project tasks associated with the performance of the work were as follows:

- Mobilization to the site,

- Site preparation and stormwater controls within the initial land disturbance area,
- Installation of erosion and sediment control measures,
- Clearing and grubbing,
- Dewatering,
- Excavate ash outside the western boundary of the 488-4D Ash Landfill and ash from surrounding roads/berms (Areas 1 and 2), place and compact in 488-4D Ash Landfill,
- Excavate ash in 488-2D Ash Basin, place and compact in 488-4D Ash Landfill,
- Grade ash within 488-4D Ash Landfill to design requirements *RADP* (SRNS 2014a) specifications,
- Construct the stormwater conveyance system,
- Excavate and haul common fill from borrow area to 488-4D Ash Landfill,
- Placement of a minimum 15.2-cm (6-in.) common fill layer over ash in 488-4D Ash Landfill,
- Installation of GCL and GDL over the 15.2-cm (6-in.) common fill layer,
- Placement of 50.8-cm (20-in.) common fill and topsoil over GDL/GCL,
- Placement of 10.2-cm (4-in.) of top soil over common fill followed by sod installation
- Installation of the subsurface drainage system,
- Regrade and place common fill in the bottom of 488-2D Ash Basin to design requirements *RADP* (SRNS 2014a),
- Stabilize the site by seeding, sodding, and placement of crushed stone surfacing,
- Land surveying throughout the duration of construction activities,
- Demobilization.

2.4 Site Mobilization

Project personnel began mobilization to the 488-4D Ash Landfill and 488-2D Ash Basin Closure project upon approval of required pre-construction submittals. The Envirocon management team

performed submittal preparation and managed equipment mobilization during this time frame. The mobilization of craft personnel began once Notice to Proceed was received. Office space was provided and installed by a local vendor. The size of the field office trailer was ~18.3 x 6.1 m (60 x 20 ft) and included office space as well as a conference/lunch room where meetings were held. The temporary office trailer and parking area was set up on one of the concrete or asphalt pads in the laydown/storage area. Several additional laydown/storage areas were established to allow for equipment maintenance, material storage, etc. These areas were designed to control stormwater runoff.

2.5 Project Surveying

Survey control points were provided to Envirocon by SRNS prior to the start of work. Control point or benchmark/monument positions (x, y, and z coordinates) were used to maintain vertical and horizontal limits during the excavation and backfill process. Control points and survey monuments were protected during construction activities. In high traffic areas, benchmarks were demarcated by three guard posts with reflective paint striping.

A GPS was used to perform the site construction layout by Envirocon's Grade Checker and/or the Envirocon Engineer (Photos 15 and 16). The GPS used Digital Terrain Models and electronic background maps to ensure continuous control of all excavation grades, limits of excavation and backfill soil placement, and minimize the possibility of induced error by limiting the number of field calculations needed to conduct layout operations.

Envirocon used a South Carolina licensed Professional Land Surveyor to set additional project control monuments where needed, perform initial pre-excavation topographic surveys, ash placement surveys, bottom of excavation topographic surveys, cover material topographic surveys, stormwater system as-built surveys and spot check construction layout staking. As-built survey data was provided to SRNS.

2.6 Stormwater Pollution Prevention and Erosion Control

All work was performed in accordance with SRNS's existing *Comprehensive Stormwater Pollution Prevention Plan (SWPPP) for the 488-4D Ash Landfill Closure* (SRNS 2014g). In

addition, all water that had contacted ash was pumped to the 488-1D Ash Basin for management in accordance with the IWT permit. All subcontractors of SRNS, including subs to the general subcontractor (Envirocon) who's work at the project site involved activities that may impact stormwater discharges or controls were required to attend a pre-construction meeting to discuss and review the conditions of the SWPPP and then sign on to the SWPPP prior to commencing any land disturbing activities.

Erosion control measures were constructed and maintained to prevent releases during activities associated with this project. The primary objectives of the storm water/erosion controls to be used for this project were to:

- Prevent the spread of ash and/or sediments during remediation activities,
- Maintain stormwater run-on/run-off within the project site boundaries,
- Provide storm water/erosion control inspection and reporting, and
- Identify locations and methods of construction of storm water/erosion control measures and their maintenance.

The work site was evaluated weekly or after rain events (1.3-cm [0.05-in.] and greater) during field operations to determine whether additional stormwater/erosion control measures were necessary. The Construction Field Engineer, Site Superintendent, Subcontract Technical Representative (STR), and SRNS Design Engineering participated in SWPPP (SRNS 2014g) inspections. Additional storm water/erosion controls were installed as needed.

2.6.1 Initial Land Disturbance

The initial erosion control measures were installed prior to the start of any excavation or other soil-disturbing activities. All storm water/erosion control features were installed in the locations identified in the design requirements *RADP* (SRNS 2014a) documents. Initial land disturbance activities included the following:

- Installation of construction entrance(s),
- Provide inlet protection for three existing stormwater inlets,
- Clearing and grubbing to allow installation of silt fence,
- Installation of silt fence and J-Trap east of 488-4D Ash Landfill,

- Install silt fence and rock check dams west of 488-4D Ash Landfill,
- Demolish and remove (D&R) existing 243.8-cm (96-in.) diameter corrugated metal pipe trash rack and concrete piers,
- Remove existing 45.7-cm (18-in.) diameter cast iron discharge pipes to side slope of basin,
- Excavate ash to allow construction of rock filter ring and outlet structure,
- D&R wood bridge, abandoned monitoring well and catch basin,
- Grout 10.2-cm (4-in.) diameter existing corrugated polyethylene pipe and abandon in place.

Front-end loaders and graders were used to construct construction entrances to the site. Construction entrances were established where vehicles access the construction site gravel or dirt roads from paved roads. Construction entrances were installed per design requirements *RADP* (SRNS 2014a) to prevent tracking of sediment by vehicles onto the hard surface road.

The areas east and west of 488-4D Ash Landfill were grubbed to the extent necessary to facilitate silt fence installation. Grubbed materials were disposed of in accordance with the *SRNS Waste Management Plan for the 488-4D Ash Landfill and the 488-2D Ash Basin* (SRNS 2014h). The area along the existing ditch west of 488-4D Ash Landfill was excavated to the extent necessary to allow installation of silt fence.

Throughout construction activities the contractor used a range of erosion control Best Management Practices (BMPs) to stabilize non-vegetated areas. Erosion control BMPs included a combination of run-off berms, check dams (Photo 17), straw waddles (Photo 18), silt fence (Photo 19), surface roughening; temporary seeding; riprap etc. to prevent the transport of ash/sediment off the project site. Inlet protection structures (Photo 18) were established around the three existing inlet structures adjacent to 488-4D Ash Landfill. Inlet protection structures were constructed by laborers using hand tools.

2.6.2 Clearing and Grubbing

The existing wooded area west of 488-4D Ash Landfill required grubbing to allow excavation of ash material. Trotter Site Preparation was responsible for clearing and grubbing the area and transporting CERCLA Sanitary Waste to Three Rivers Landfill. Grubbed materials were size reduced to meet the waste acceptance criteria at the landfill, loaded into trucks and hauled to Three

Rivers Landfill. Photos 20 and 21 shows clearing and grubbing activities at the 488-4D Ash Landfill. SRNS provided and signed waste manifests for the waste materials transported to the landfill. The CERCLA Off-Site Rule Documentation for the Three Rivers Landfill is provided in Appendix G.

2.6.3 Dewatering

All stormwater was removed/managed in accordance with the SWPPP (SRNS 2014g). Prior to discharge, any water that had contacted ash was removed and managed in accordance with the current NPDES permit and/or transferred within the existing IWT permitted basin complex (i.e., 488-1D Ash Basin or associated inlet basins) and then sampled per existing NPDES requirements prior to discharge into the Discharge Canal. Since there was sufficient storage capacity in the 488-1D Ash Basin and 488-1D inlet basins, NPDES permitted industrial wastewater (i.e. ash contaminated) was transferred to the existing IWT permitted 488-1D basins without any ongoing discharge occurring as part of this removal action. No NPDES permitted industrial wastewater (i.e. ash contaminated) was directly discharged to surface water as part of this removal action.

2.7 Ash Excavation and Grading

2.7.1 488-2D Ash Basin Ash Excavation

Following removal of water from 488-2D Ash Basin, areas of ash in the basin bottom remained saturated with little bearing capacity and were unable to support heavy equipment. To facilitate ash excavation, it was necessary to construct temporary access roads into the 488-2D Ash Basin. Roads were spaced 24.4 m (80 ft) on center throughout the 488-2D Ash Basin (Photo 22). Excavation was performed by a 40-metric ton excavator equipped with GPS. The GPS model was developed from the excavation surface for the 488-2D Ash Basin. Roads were constructed of common fill material excavated and hauled from the Common Fill Borrow Site in D Area borrow pit to the 488-2D Ash Basin. Fill was placed by a dozer and compacted by truck traffic and/or vibratory drum compactor. Lift thickness was sufficient so that heavy equipment could travel on the access roads without breaking through. As ash was excavated, the roads were removed. Tracked excavators excavated ash and placed the material in 30-ton articulated haul trucks (Photo 23). The trucks used the temporary access roads to haul material from the

488-2D Ash Basin to the 488-4D Ash Landfill. Trucks were loaded in a manner which prevented spilling of material during transport between the areas. Material used to construct roads was temporarily stockpiled within the area of disturbance or incorporated into the ash material that was placed in the 488-4D Ash Landfill.

2.7.2 Ash Placement, Conditioning, Grading and Compaction

Ash was hauled in articulated off road trucks from the 488-2D Ash Basin to the top of the 488-4D Ash Landfill. It was then dumped onto the existing ash surface and spread into 15.2-cm (6-in.) to 30.4-cm (12-in.) thick loose lifts by a D-6 size dozer equipped with GPS. Lift thickness was dependent on moisture content of ash. Ash that was too wet to compact was spread and allowed to dry. A disc or plow was used to turn the wet material to assist in drying. Dry ash from the perimeter of 488-4D Ash Landfill was mixed with wet material to facilitate drying. The accessible footprint of the 488-4D Ash Landfill allowed sufficient space to dry ash prior to compaction. When rain was forecast, the ash surface was sealed by compacting with a vibratory smooth drum compactor to minimize impacts of precipitation (Photos 24 and 25). During periods of heavy rainfall, work related to ash placement, conditioning, grading and/or compaction was essentially stopped until conditions became manageable. When the ash surface had dried sufficiently to allow for the operation of equipment, the ash surface was disked/harrowed and allowed to dry until it could be compacted.

Calciment (quicklime) was used to aid in drying of excessively saturated ash within the 488-4D landfill (Photo 26). The addition of quicklime was required for strength stabilization of the ash in order to meet the landfill compaction requirements. Quicklime has been used successfully for strength stabilization of saturated sediments on many sites. See Appendix H (SCDHEC 2015b) for SCDHEC approval of the use of this material in the 488-4D Ash Landfill.

When the ash had dried to the extent needed to successfully compact, a vibratory compactor was used to compact each lift (Photo 27). The compactor made a minimum of five passes over the material. After four lifts were placed and compacted, the surface of the ash was proof rolled to demonstrate successful compaction. Proof rolling was performed in the presence of the Testing Laboratory Technician, STR and SRNS Design Engineer. A four-wheeled (minimum) pneumatic

tired piece of heavy equipment not weighing less than 25 tons was used for proof rolling the ash surface (Photo 28). Any areas that exhibit pumping or softness were excavated a minimum of 45.7-cm (18-in.) and reconditioned until material characteristics allow for successful proof rolling.

Existing ash located in 488-4D Ash Landfill required regrading to achieve lines and grades presented in the construction drawings. A dozer equipped with GPS cut the ash surface to design grade and a front-end loader moved the ash to its placement location. Ash that was cut from within 488-4D Ash Landfill was drier than the material located in 488-2D Ash Basin. Some of the drier material was incorporated into the wet material to facilitate compaction. If dry ash was added to wet material, it was mixed by plough or disc so that moisture content throughout the lift was uniform.

2.7.3 Survey and Approval from SRNS of Ash Removal

Once all ash had been placed in the 488-4D Ash Landfill, SRNS performed a visual inspection of the site to confirm that all ash had been placed in the landfill in accordance with the design requirements *RADP* (SRNS 2014a) (Photos 29). Following the visual inspection performed by SRNS, a topographic survey of the finished ash surface (As-built Ash Layer, Appendix K.1) was developed by the contractor. Data from the topographic survey was provided to SRNS for evaluation against the existing cap design. A summary of ash/contaminated soil placed into the 488-4D Ash Landfill is provided is provided below in **Table 3**.

Table 3. Ash Consolidation Quantities

Ash Consolidation Quantities		
Material (ash and contaminated soil) Moved from Location Identified Below to the 488-D Ash Landfill	**Volume** *(yd^3)*	**Volume** *(m^3)*
488-2D Ash Basin and Areas 1 and 2	76,000	58,106
Area west of the 488-4D Ash Landfill	14,800	11,315
TOTAL	**90,800**	**69,421**

Approximate final volumes shown

The permitted design capacity of the 488-4D Ash Landfill is 749,264 cubic meters (m^3) (980,000 cubic yards [yd^3]). Based on Design Engineering evaluation comparing the as-built (As-built Ash

Layer Appendix K.1) drawing versus the original basin design drawing (W705904) the total volume of ash in the 488-4D Ash Landfill is estimated to be 745,441 m^3 (975,000 yd^3).

2.8 Common Fill

Common fill was sourced from the on-site borrow pit, ~3.2-km (2-miles [mi]) east of 488-4D Ash Landfill known as the D Area Borrow Site (Photo 30). The borrow area was cleared, grubbed and partially excavated by SRNS prior to the start of mobilization and prior to the borrow area being turned over to the contractor. Borrow material was used in the 488-2D Ash Basin, outside the west of the 488-D Ash Landfill, the 15.2-cm (6-in.) common fill layer over the ash mound in the 488-4D Ash Landfill, and the 50.8-cm (20-in.) thick common fill layer over the GCL/GDL in the 488-4D Ash Landfill. A summary of common fill placed during Phase 1 of the project is provided in **Table 4**.

Table 4. Bulk Common Fill Quantities

Bulk Quantities		
Common Fill	**Volume** *(yd^3)*	**Volume** *(m^3)*
488-2D Ash Basin Bottom, North Berm, and Areas 1 and 2	59,600	45,567
Area west of the 488-4D Ash Landfill	11,200	8,563
Cover System 6-inch common fill layer	21,300	16,285
Cover System 20-inch common fill layer	59,100	45,185
TOTAL	**151,200**	**115,600**

Approximate final volumes shown

2.8.1 Hauling, Placement and Compaction of Common Fill

Material from the borrow area was excavated in accordance with the borrow area *SWPPP* (SRNS 2014i). Tracked excavators and rubber tire loaders were used to excavate material and loaded into haul trucks. The material was hauled to the construction site where it was dumped and spread by a dozer equipped with GPS.

The initial backfill of utility trenches was placed in uniform loose lifts along both sides of the pipe concurrently using a loader. Lifts were placed in 30.5-cm (12-in.) loose lifts. The initial lifts, those in the immediate vicinity of piping or associated structures, were compacted using a plate or

utility compactor (Photo 31). Horizontal locations, size and vertical elevations of associated structures and appurtenances were incorporated into the Utility As-Built Survey (Appendix K.6, As-Built Subsurface Drains & Utilities) prior to the execution of backfill.

Following removal of ash material from the 488-2D Ash Basin, the surface of the basin was regraded and filled with common fill to achieve the final grade shown in the design drawings. A dozer equipped with GPS was used to cut and place material in 488-2D Ash Basin. Common fill from the borrow area was placed in areas that required fill to achieve the final grade **(**Photos 32 and 33). A vibratory smooth drum compactor was used to compact the fill to design requirements (SRNS 2014a).

The 15.2-cm (6-in.) common fill cover over the ash and 50.8-cm (20-in.) common fill cover over the geosynthetics are discussed in Section 2.9.

2.9 488-4D Ash Landfill Cover

This section includes discussion on the storage of the GCL and GDL and installation of the geosynthetic cover system for the 488-4D Landfill. This section includes the following:

- Placement of 15.2-cm (6-in.) common fill base layer including subgrade acceptance,
- GCL and GDL storage,
- GCL and GDL Installation, and
- Placement of 50.8-cm (20-in.) common fill over the GDL

ESI was contracted to install all GCL and GDL liner materials at the 488-4D Ash Landfill.

2.9.1 6 Inch Common Fill Base layer

Common fill material from the D Area Borrow Site was used for the base layer. For the 15.2-cm (6-in.) common fill layer a dozer spread material into a loose lift ~17.8- to 20.3-cm (7- to 8-in.) thick. Moisture content was adjusted as necessary and the material compacted with a vibratory compactor. The 15.2-cm (6-in.) common fill layer serves as a base for GCL and GDL placement. The vibratory compactor made a minimum of five passes over the fill material per design requirements (SRNS 2014a) (Photo 33).

2.9.2 GCL and GDL Material Acceptance and Storage

All geosynthetic materials were in accordance with the design requirements (SRNS 2014a). As the materials off loaded, the rolls were inspected for damage. No damaged GDL or GCL materials were found and the rolls were placed into storage on appropriate dunnage with minimal handling. Cloth chokers and spreader bars were used to handle materials. A spreader bar was attached to a steel bar inserted through the center core of the roll to pick and move GCL and GDL. Original packaging material remained on the rolls until immediately prior to installation. For additional protection, polyethylene sheeting was placed over the rolls (Photo 34).

2.9.3 GCL and GDL Installation

Immediately prior to installation, the 15.2-cm (6-in.) common fill layer was fine graded and rolled with a smooth drum roller and inspected and documented by a qualified Quality Control (QC) Inspector. Any rocks and sticks found at that time were removed. The GCL was deployed using all terrain forklifts in the orientation recommended by the manufacturer. The GDL installation was performed concurrently with GCL installation. The number of panels installed was limited to the square footage that could be covered with common fill and the working edge protected by tarps at the end of the day. At catch basins, the GCL was tied to the catch basin and the penetration sealed in accordance with GCL manufacturer's written instructions and the *RADP* (SRNS 2014a) (Photo 35). Backfilling and compaction of common fill and topsoil to final grade followed completion of tie-in activities.

GDL and GCL were installed starting at the east side of 488-4D Ash Landfill progressing westward. Installation in parallel facilitated daily placement of common fill over the GDL. The loads placed on the GCL and GDL during installation were limited to prevent damage as prescribed by the manufacturer. As GDL/GCL materials were placed, the anchor trench was excavated and prepared for liner installation (Photos 36 through 41). Temporary ditches, swales, and or sandbags were used to divert water from the surface of the GCL/GDL. Any repairs were made in accordance with the manufacturer's recommendations and the *RADP* (SRNS 2014a). Approximately 8.9 hectares (22 acres) of each of the geosynthetic materials (GCL/GDL) were placed. All geosynthetic materials were installed in accordance with the manufacturer's recommendations and

the *RADP* (SRNS 2014a). Unique numbers were assigned to each panel placed (Photo 42). A qualified QC Inspector monitored and documented the installation of the GDL and GCL.

2.9.4 488-4D Ash Landfill Placement of 20-Inch Common Fill Lift over GDL

The initial lift of the 50.8-cm (20-in.) common fill layer over the geosynthetic materials was placed in parallel with the installation of GCL and GDL. Common fill was hauled from the borrow pit and spread over the GDL by a D-6 size LGP dozer equipped with GPS. The initial lift was between 30.5- and 38.1-cm (12- and 15-in.) loose thickness. Fill was pushed out over the GDL in an upward tumbling as prescribed by the manufacturer, to prevent wrinkles in the geosynthetics. Dumping of fill on the GDL was limited to a maximum of 0.9 m (3 ft). On slopes, fill was placed from the bottom of the slope upward. The equipment used to place the fill was not allowed to operate directly on the geosynthetics. Compaction of the initial lift of material above the GDL was accomplished by traffic compaction with ground pressure less than 7 pounds per square inch making at least two passes over the area as required by the design.

Parallel placement of soil cover material over the geosynthetics ensured that the materials were covered by the end of each day. Rain tarps and sand bags were deployed over the working edge of the geosynthetics materials at the end of the each day. This was limited to the transition areas that could not be covered with fill material until the adjacent panels of geosynthetics materials were installed. Any GCL damaged by rain was required to be replaced.

The remaining fill was placed in a lift thickness that resulted in an overall common fill layer of 50.8-cm (20-in.). Fill was placed with a D-6 LGP dozer and compacted as specified in the design requirements *RADP* (SRNS 2014a). A vibratory compactor was used to ensure material was compacted to the specification. The placement of topsoil and sodding are described in Sections 2.12.1 and 2.12.2, respectively.

2.10 Subsurface Drainage and Stormwater Conveyance Systems

The overall 488-4D Ash Landfill Subsurface Drainage and Stormwater Conveyance Systems consists of the following:

- Perimeter subsurface drainage piping,
- Perimeter surface ditch,
- Catch basins,
- Culverts,
- Manhole/manhole tie ins, and
- Riprap aprons.

The 488-4D Ash Landfill subsurface drainage consist of ~1386.8 m (4,550 ft) of perforated subsurface piping for the collection of any water that penetrates the 61-cm (70-in.) soil cover. Any water that penetrates the 61-cm (70-in.) soil cover is directed by the GDL to the subsurface drain piping and conveyed to the catch basins. The 488-4D Ash Landfill perimeter surface ditch follows the same course as the surface drainage system. There are five catch basins which collect water from the surface ditches and the perforated subsurface piping. Stormwater collected in the two catch basins on the north side of the 488-4D Ash Landfill is directed to existing stormwater manholes located at the southeast and southwest corners of the 488-D Ash Basin. Stormwater collected in the three catch basins on the south side (east, west and center) of the 488-4D Landfill is directed to 488-2D detention pond through three culverts.

2.10.1 488-4D Ash Landfill Piping, Culverts, Catch Basins, and Manhole

All structures and piping to include subsurface drainage piping, culverts, catch basins, and a manhole were installed to the lines and grades as specified in the design requirements *RADP* (SRNS 2014a). Bedding material (stone aggregate) was placed, graded and consolidated using a plate or utility compactor prior to installation of the pipe (Photos 31, 43, and 44). Tie-in to catch basins and manholes were completed as required. As-Built surveys were completed prior to any backfilling.

The surface drainage pipe trench (Photo 45) was lined with geosynthetic filter fabric and filled with gravel. The surface drainage pipe was placed such that the orientation of the holes faced down approximately in the center of the trench and 5.1 cm (2 in.) from the bottom of the trench. The geosynthetic filter fabric is then wrapped around and overlapped.

The remaining backfill (common fill) around and over piping, culverts and structures was placed in specified loose lift thickness and compacted in accordance with design requirements *RADP*

(SRNS 2014a). The material was placed using loaders, excavators and various compaction equipment.

2.10.2 Rip Rap Aprons

The riprap aprons consist of riprap, #57 stone, and non-woven geotextile filter fabric. The subgrade for the filter fabric and rip rap was constructed to the lines and grades provided in the design requirements *RADP* (SRNS 2014a). Any fill required for the subgrade was compacted to the density of the surrounding undisturbed material using a plate compactor or vibratory drum compactor. Filter fabric was installed over the soil surface where the riprap apron was to be placed. A minimum of 5.1 cm (2 in.) of gravel bedding (#57 stone) was placed between the filter fabric and riprap to prevent damage to fabric when placing rip rap. The aprons were constructed to the grades required by design. The top of riprap at downstream end was level or slightly below the receiving area. All disturbed areas around the apron were stabilized with vegetation after construction (Photo 46).

2.11 488-2D Ash Basin Outlet Structures

This section provides details pertaining to the installation of the 488-2D Ash Basin outlet structures. Once the ash had been removed from the basin bottom and confirmation sampling completed, the two outlet structures were constructed in the 488-2D Ash Basin, one through the east berm and one through the west berm. A temporary rock ring filter was installed to grade. A non-woven geotextile fabric was placed over the soil surface where the rock filter ring was constructed. The body of the rock ring filter was comprised of D_{50}=22.9-cm (9-in.) riprap. The riprap was placed by hand or by mechanical means achieving complete coverage and appropriate grade. A 30.5-cm (12-in.) thick filter layer of washed stone was placed on the upstream face.

Construction of the outlet structures began upon completion of the rock ring filter. An excavator excavated a 248.9-cm (98-in.) diameter hole down 0.6 m (2 ft) into the subgrade. The bottom 30.4 cm (12 in.) was filled with a stone base from where the riser was lowered using a loader (Photos 47 and 48). Using an excavator, a trench was excavated through the berm and road to the preexisting drainage ditch. The trench was dug to a depth that ensured that the head of the 61-cm (24-in.) reinforced concrete pipe discharge pipe inlet and outlet invert elevations were constructed

per design requirements *RADP* (SRNS 2014a). Riprap aprons were then installed as described in Section 2.10.

The 488-2D Ash Basin in its completed configuration will operate as a detention basin. In the interim, until the completion of Phase 2, the 488-2D Ash Basin will operate as detention/ sediment basin and the sediment control float as shown in Photo 48 will remain in place. The temporary rock ring filter(s) have been removed

2.12 Installation of Final Vegetative Cover and Crushed Stone Surfacing

All surfaces disturbed by construction activities received seed, sod, or crushed stone surfacing prior to project completion (Photos 49 and 50).

2.12.1 Topsoil

Topsoil for the 488-4D Ash Landfill and 488-2D Ash Basin was supplied from an off-site source located in Jackson, SC. SRNS performed analytical testing of the topsoil as described in more detail in Section 4.2 and Appendix M. Once the topsoil was sampled, the topsoil was not disturbed (soil added or removed) until evaluation and acceptance of the analytical results.

A 10.2-cm (4-in.) layer of topsoil was placed over the 488-4D Ash Landfill, 488-2D Ash Basin and any other areas disturbed by construction activities that received seed or sod. Prior to topsoil placement, the surface was scarified to a depth of 5.1 cm (2 in.). Topsoil was delivered to the site by dump trucks and either dumped on the scarified surface or staged elsewhere in the area of disturbance until placed. D-6 dozers equipped with GPS were used to place the topsoil in a uniform layer. The topsoil was compacted by the weight of the dozer or other equipment operating on the surface; no other compaction was required. The surface of the topsoil was smoothed by raking or using a drag mat to achieve a uniform surface. Any rocks or sticks were removed prior to seeding or sodding. An As-Built topographic survey (Appendix K.5, As-Built Topsoil Cover Drawings) of the finished topsoil surface was taken prior to installation of sod or seeding. A summary of topsoil quantities is provided in **Table 5**.

Table 5. Summary of Topsoil Quantities

Topsoil Quantities		
Topsoil	**Volume** *(yd^3)*	**Volume** *(m^3)*
488-4D Ash Landfill	11,800	9,022
Area West of 488-4D Ash Landfill	850	650
488-2D Ash Basin	7,900	6,040
TOTAL	**20,550**	**15,712**

Approximate final volumes shown

2.12.2 Sod Installation

Carolina Sodding Services was responsible for installing sod, permanent seed and related materials for the project. Lime and fertilizer were applied to topsoil within 72 hours of topsoil placement and mixed into soil. The soil was wetted prior to sod placement. Sod was transported from delivery trucks to ground surface with track loaders. The sod was placed on topsoil so that sod to soil contact was maintained over the entire area and joints were staggered. Laborers used rakes and machetes to tighten seams and trim and patch areas. After installation, the sod was rolled with a lawn roller perpendicular to the direction it was laid. Newly installed sod was watered to wet the soil to a 7.6-cm (3-in.) depth. Watering was performed as required by weather conditions at the time of installation of sod/seed utilizing travelling irrigation systems. A total of ~15.4 ha (38.1 ac) of sod was placed (Photos 49 and 50).

2.12.3 Seed Installation

Seed was planted by mechanical spreader at the rate and mixture stated in the specification for the time of year the seed was planted. Seeded areas were lightly dragged to cover seeds and maintain a surface free of ridges and depressions. Straw mulch was placed at a rate of 1,814.4 kilograms (kg) (4,000 pounds [lbs.]) per acre within 24 hours of seed placement. Mulch was anchored 7.6 cm (3 in.) into soil with a disc or other farm implement. Soil was maintained in a moist condition until acceptance by SRNS.

2.12.4 Crushed Stone Surfacing Installation

Crushed stone surfacing was placed in areas around the project site as specified in the design drawings (Photo 50). The width and depth of gravel paving was installed per design requirements *RADP* (SRNS 2014a). Vibratory compactors were used to construct a dense uniform surface.

2.13 Demobilization

Envirocon was the successful bidder of the Phase II contract for the project. As such, As-Builts, final submittals, and contractor closure documents comprised the majority of the effort for the completion of the Phase I project scope.

2.14 CERCLA Sanitary Waste

Waste management (handling, disposal and consolidation) and transportation of construction generated wastes) has met the requirements of Federal and State regulations and applicable SRS manuals and procedures (e.g., SRS 3Q Manual, Environmental Compliance Manual [SRNS 2014j]; SRS C1 Manual [SRNS 2014k], Environmental Restoration Administrative Procedures, etc.). Waste reduction and recycling techniques were utilized as necessary for waste minimization.

Shipment of waste and construction debris (including preparation, packaging, and appropriate certifications) to disposal facilities were performed in accordance with the SRS 3Q Manual (SRNS 2014j) and the project specific *Waste Management Plan for the 488-4D Landfill and 488-2D Ash Basin Removal Action* (SRNS 2014h). The Generator Certification Official was responsible for ensuring the proper shipping manifests were available. Appendix G contains the verification documents for the CERCLA Off-Site Acceptability of Three Rivers Landfill.

Table 6 provides detail of waste stream activity and waste description.

Table 6. Waste Streams

Activity	Waste Description	Approximate Volume (Tons)	Approximate Volume (Metric Tons)
Sluice Line Removal	Ceram Core® Pipe, 8-inch Carbon Steel Pipe, 6-inch PVC, Wood Support Poles	164	149
Phase 1 Clearing and Grubbing	Root balls, Stumps, Misc. Vegetation	448	406

3.0 DEVIATIONS FROM ORIGINAL DESIGN

There were fourteen deviations from the original design that occurred during the removal action. These design changes were all minor in nature and did not result in any major cost or schedule impact. **Table 7** provides a summary of the deviations.

Table 7. Summary of Design Changes/Deviations (Note 1)

Item	Deviation (Note 1)	Reason (Note 2)
1	Permanent Access Ramp into 488-2D	Support future maintenance activities.
2	Use of Drying Agents	Approve the use of "Calciment" as an aid in the drying of ash in the 488-4D Ash Landfill. See Note 3 (SCDHEC 2015b).
3	Marlee Float Skimmer	At the request of the contractor revised the Faircloth Skimmer to a Marlee Float Skimmer. The Marlee Skimmer is on the South Carolina Department of Transportation Qualified Products List and meets design requirements *RADP* (SRNS 2014a).
4	Changed Permanent Grassing on 488-2D Western and Southern Berms to Stone Aggregate	Exceeds requirements. Change at the convenience of the subcontractor to meet completion dates.
5	Permanent Access Ramp on lower (3 to 1) Slope 488-4D Landfill	Support future maintenance activities.
6	Geotextile used for aprons, check dams, temporary construction entrances, etc.	MIRAFI 1100N was specified in the design requirements *RADP* (SRNS 2014a). The contractor requested the approval of an equal product Terra Tex N10.
7	Rip Rap Spec Change	D_{50} = 12-inch rip rap was not readily available from local suppliers. The requirement was revised to GADOT D_{50} = 9-inch rip rap.

Table 7. Summary of Design Changes/Deviations (Note 1) *(Continued/End)*

Item	Deviation (Note 1)	Reason (Note 2)
8	Revise requirement from Abandon 24 in. Pipe and Fill with Concrete to Remove and Backfill	For contractor convenience. Meets design requirements *RADP* (SRNS 2014a).
9	Revise Surface Drainage System Piping Type	Initial subsurface drainage (SSD) piping type called out in the design was not available.
10	Sub Surface Drainage System Bedding	Initial bedding material called out in the design did not allow for proper support of the subsurface drainage pipe.
11	Change 488-2D Basin Bottom Grassing to Sodding	Exceeds requirements. Change at the convenience of the subcontractor to meet completion dates.
12	Revised the North Side 488-4D Cover. Termination and Tied into the Existing 488-D Cover	During rough grading along the north side of 488-4D in preparation for construction of the current closure cap design, additional ash was discovered to exist beyond the northern limits of cover. Since the currently designed 488-4D cover did not interface with the existing closure cap of 488-D to the north, this additional ash would not be covered by a closure cap. See Note 3 (SCDHEC 2015b and USDOE 2015).
13	Revised SSD Drain Details	To bring in line with recommended manufactures' most current details. See Note 3 (SCDHEC 2015b and USDOE 2015).
14	Relocation of the 488-2D West Berm Outlet Structure.	Ash was identified in the northwest corner of the 488-2D requiring removal of a portion of the berm. The outlet structure was relocated to mitigate cost and schedule issues.

Notes:
1) The deviations listed are in no specific order.
2) All changes were evaluated and approved by Design Engineering.
3) Changes noted were also approved by SCDHEC (Appendix H).

4.0 VERIFICATION SURVEYING, PERFORMANCE STANDARDS, AND CONSTRUCTION QUALITY CONTROL

To ensure the "Performance Requirements and Standards" were achieved, the Project Team personnel comprised of SRNS Area Completion Projects (ACP) Engineering, Project Management, Quality Assurance, Safety, the STRs and Design Engineering performed routine monitoring/surveillance activities, as required by the approved construction procedures. ACP Engineering performed various functions including routine field oversite, verification of sampling results, sampling data management, and evaluation and acceptance of the analytical results. SRNS Quality Assurance performed surveillances of subcontractors as required by the SRNS Quality Assurance Program. Dedicated SRNS STRs were assigned to follow all work throughout the construction/removal process. The Envirocon professional engineer (PE) stamped and signed

letters certifying that the construction activities for the 488-2D Ash Basin and 488-D Ash Landfill were completed in accordance with design specifications *RADP* (SRNS 2014a) and are included in Appendix I.

4.1 Design Engineering Title III Construction Support Activities

SRNS Design Engineering provided Title III Construction Support throughout the construction phase of the project. The following elements of work were included in the project as Design Engineering Title III Construction Support activities:

- Review and evaluation of all proposed deviations for the original "Detailed Design" for conformance with regulatory requirements, codes, and standards;
- Review of all vendor drawings and submittals for conformance with the approved design requirements *RADP* (SRNS 2014a) and drawings;
- Inspection of the construction contractor's workmanship, materials, and equipment and reporting on their conformance or nonconformance with the approved drawings and specifications;
- Verification of field test (compaction/proof rolling), laboratory tests, manufacturer's testing as necessary to ensure that construction materials and practices are in accordance with the approved drawings and specifications;
- Verification of the incorporation of all approved as-built record drawings: and
- Verification that planned quality control measures were implemented and evaluated the results of those measures to ensure that the work was completed in accordance with the approved plans and specifications.

Based on the reviews, inspections, and verifications by Design Engineering, the project team and the Envirocon PE stamped and signed letters (Appendix I). All construction activities for the 488-2D Ash Basin and 488-D Ash Landfill were completed in accordance with design requirements *RADP* (SRNS 2014a). The data identified below is included in the appendices of this document and provides documented evidence for the project requirements.

4.2 Fill Material and Topsoil Evaluation

Soil samples were collected from two source areas and evaluated per the requirements of the *SRS Fill and Soil Cover Material Verification Protocol* (WSRC 2003). These two areas are the

Common Fill Borrow Site located near D Area at the SRS, and the Jackson Stockpile located outside the SRS boundary in Jackson, South Carolina. The soil was used as fill material and/or top soil for the 488-2D Ash Basin and the 488-4D Ash Landfill. The evaluation concluded that the soil from both of these source areas met the requirements for use as fill material/top soil under an unrestricted (residential) land use scenario. The supporting text and documentation are located in Attachment M.

4.3 Confirmation Sampling (488-2D Basin and Area West of 488-4D)

Confirmation sample results were evaluated to demonstrate that the ash has been successfully removed from the 488-2D Ash Basin and the Area West of the 488-4D Ash Landfill. The confirmation sampling was conducted in accordance with the *Confirmation Sampling and Analysis Plan for Coal and/or Ash Removal at the Savannah River Site* (SRNS 2013) and the *Field Sampling Plan for the 488-2D Ash Basin* (SRNS 2014f). The confirmation sampling results were formally assessed in the *Human Health and Ecological Evaluation for Confirmation Sampling at the 488-2D Ash Basin* (SRNS 2016a). This evaluation identified several uncertainties which lead to the conclusion that the results were indeterminate with regard to meeting acceptance criteria for unrestricted (residential) land use. The report acknowledged that land use controls to prevent unrestricted use would need to be implemented at the 488-2D Ash Basin and Area West of the 488-4D Ash Landfill to manage these uncertainties, as well as to protect the overall infrastructure and maintenance of the D-Area Operable Unit closure. The *Data Usability Report for Confirmation Sampling at the 488-2D Ash Basin* is presented in Appendix U.

5.0 VERIFICATION OF CONSTRUCTION COMPLETION AND FINAL INSPECTION

5.1 Verification of Construction Completion

Per Section 4.0, construction activities required for the removal action have met the acceptance criteria established in the approved *RSER for the D-Area Ash Basin (488-2D)* (SRNS 2014b), *RSER/EE/CA for the D-Area Ash Landfill 488-4D* (SRNS 2014c), *RADP* (SRNS 2014a), *Confirmation Sampling and Analysis Plan for Coal and/or Ash Removal at the Savannah River Site* (SRNS 2013) and *Field Sampling Plan for the D-Area 488-2D Ash Basin* (SRNS 2014f). The

results of the analytical sampling and construction testing have been documented and the records were on file in SRS Environmental Restoration Data Management System and in the attachments included in this report.

The performance requirements were verified as meeting the Data Quality Objectives (DQOs) documented in the *Confirmation Sampling and Analysis Plan for Coal and/or Ash Removal at the Savannah River Site* (SRNS 2013). The DQO process is a series of logical steps that guides managers or staff to a plan for the resource-effective acquisition of environmental data. The DQO process was used to establish performance and acceptance criteria, which served as the basis for designing a plan for collecting data of sufficient quality and quantity to support the goals of the project. Use of the DQO process lead to efficient and effective expenditure of resources; consensus on the type and quantity of data needed to meet the project goal; and the full documentation of actions taken during the development of the project. The DQO process is a series of seven (7) planning steps based on the scientific method (Section 3 in SRNS 2013) and is detailed in USEPA Guidance (USEPA 2006). The *Data Usability Report for Confirmation Sampling at the 488-2D Ash Basin* is presented in Appendix U.

5.2 Final Inspection

A final walk down inspection with participation of USDOE, USEPA, SCDHEC and SRNS was performed on November 3, 2016 (Appendix F, USDOE 2016). The personnel present observed and discussed the construction activities within the 488-2D Ash Basin and the 488-4D Ash Landfill. The final walk down inspection included:

488-4D Ash Landfill

- All ash within the scope of the 488-2D *RSER* (SRNS 2014b) and 488-4D *RSER/EE/CA* (SRNS 2014c) has been consolidated and placed within 488-4D Ash Landfill.
- All construction activities for the installation of the SCDHEC Class Three Landfill cover have been completed.
- The location of the four groundwater monitoring wells (one up gradient and three down gradient) were identified along with the schedule for installation. Installation of the wells has been completed.

- The SCDHEC Bureau of Land and Waste Management and other participants observed the interior of the installed active stormwater catch basin located off the northeast corner of 488-4D Ash Landfill to confirm proper installation.
- The NTCR action for the 488-4D Ash Landfill is complete.

488-2D Ash Basin

- Ash within the 488-2D Ash Basin bottom has been removed from the basin.
- Confirmatory sampling has been completed and all data has been incorporated into the *Human Health and Ecological Evaluation for Confirmation Sampling at the 488-2D Ash Basin* (SRNS 2016a).
- Soil cover and sod installation were completed per the *RADP* (SRNS 2014a)
- Sediment control floats (Photo 48) will remain on the discharge structures throughout the 488-1D Ash Basin construction project.
- The TCR action for the 488-2D Ash Basin is complete.

6.0 AS-BUILT DOCUMENTATION

6.1 As-Built Drawings

As-built documentation for the project as described below is included in Appendix K.

- As-built Ash Layer
- As-built 6 in. Common Fill Layer
- As-built GCL Liner
- As-built GDL Layer
- As-built Topsoil Cover
- As-built SSD & Utilities
- As-built Final 488-4D & 488-2D

6.2 Well Modifications

All well installations and abandonments were coordinated with SCDHEC. SCDHEC approvals are provided in Appendix T.1 (SCDHEC 2014c, SCDHEC 2015c, SCDHEC 2016a and SCDHEC 2016b and SCDHEC 2016c).

A total of five (5) wells (DCB 16R, DCB 47C, DCB075, DCB076 and DCB 13R) were abandoned for the construction activities related to the Phase 1 (488-4D Ash Landfill and

488-2D Ash Basin) removal activities. The wells were abandoned on September 2, 2014, in accordance with SRS Manual 3Q1, *Environmental Requirements and Program Documents*, Procedure 9010, *Well Abandonments*. Well Abandonment Reports for these wells are included in Appendix T.3 (SRNS 2014l and SRNS 2016b).

Four replacement wells (DCB077, DCB078, DCB079 and DCB080) were installed around the 488-4D Ash Landfill. The monitoring well installation reports and well development field parameters for these groundwater monitoring wells are included in Appendix T.2 (SRNS 2017). Figure 4 show both new and abandon wells around the 488-4D Ash Landfill.

7.0 POST CONSTRUCTION ACTIVITIES

Interim post-construction activities completed for the 488-2D Ash Basin and the 488-4D Ash Landfill removal actions as defined in the *RADP* (SRNS 2014a) include the following:

- The 488-4D Ash Landfill will be maintained and inspected quarterly in accordance with the 488-4D Landfill Closure Plan.
- The 488-2D Ash Basin will be maintained and inspected quarterly as part of the storm water management system associated with the 488-4D Ash Landfill.
- The site will also be inspected following any rain event 2.5 cm (1 in.) or greater within a 24-hour period for one year following the final walk down inspection by the USDOE, USEPA, and SCDHEC (*RADP*, SRNS 2014a).

Removal actions for the 488-2D Ash Basin and 488-4D Ash Landfill are complete and the removal action goals have been met. An Early Action Statement of Basis/Proposed Plan for the DAOU is scheduled for submittal in February 2018 and will document that the preferred remedial action for the 488-2D Ash Basin and 488-4D Ash Landfill are LUCs. The selected remedial action will be documented in a Second Early Action Record of Decision for the DAOU scheduled for issuance in June 2019.

The 488-4D Ash Landfill will be maintained and inspected quarterly in accordance with the 488-4D Landfill Closure Plan until the DAOU Early Action LUCIP is approved and implemented. This quarterly inspection will include the 488-2D basin as part of the storm water management

system associated with the 488-4D Ash Landfill. In addition to quarterly inspections, the site will also be inspected following any rain event 2.5 cm (1 in.) or greater within a 24-hour period for the first year following the core team walk down and acceptance *RADP* (SRNS 2014a). Groundwater monitoring will be completed in accordance with the D-Area Groundwater Operable Unit regulatory agreements.

8.0 PROJECT COSTS

The final cost associated with the removal action of Phase 1 of the project was $19,877,058 (i.e., direct and indirect costs). This was ~20.2% higher than the cost estimate of $16,533,564 combined totals of cost presented in the 488-2D Ash basin *RSER for the D-Area Ash Basin (488-2D)* (SRNS 2014b) and *RSER/EE/CA for the D-Area Ash Landfill 488-4D* (SRNS 2014c).

The primary elements that contributed to the increase in the direct cost of $1,279,722 (+13.9%) included:

- Under Earned Value Management System all historical cost, e.g. early maintenance activities related to the project including total cost of the sluice line removal, borrow pit development, and road enhancements etc. are included in the actual cost as shown in **Table 8**. These historical costs were not included in estimates in the *RSER for the D-Area Ash Basin (488-2D)* (SRNS 2014b) and *RSER/EE/CA for the D-Area Ash Landfill 488-4D* (SRNS 2014c).
- Additional construction cost related to the redesign of the northern and eastern sides of the 488-4D Ash Landfill cover and additional ash removal.
- Additional ash removal, including the cost of backfilling.

The major increase was related to the indirect cost which was $2,063,722 (+28.2%) greater than expected (Table 8). This increase is primarily related to the implementation of the DOE Order 413.3B criteria for Capital Asset Projects. Based on the Total Project Cost several independent assessments were required by USDOE Headquarter organizations. Additional information is included below on the increased costs:

- Implementation of the DOE Order 413.3B for the project required additional project management support, increased number of Cost Account Managers and an increased number of Project Control personnel.

- The cost related to additional sampling, analysis, and reporting.

- The inclusion of the historical conceptual design cost not accounted for in the estimates in the *RSER for the D-Area Ash Basin (488-2D)* (SRNS 2014b) and *RSER/EE/CA for the D-Area Ash Landfill 488-4D* (SRNS 2014c).

Table 8. Project Cost Comparison

Project Cost Comparison			
Cost Element	**RSER Estimated Cost** *($)*	**Actual Cost** *($)*	**Delta Cost** *(%)*
Direct Costs	$9,218,231	$10,498,003	+13.9
Indirect costs	$7,315,333	$9,379,055	+28.2
Total Project	**$16,533,564**	**19,877,058**	**+20.2**

Mr. Robert H. Pope
Savannah River Site Remedial Project Manager
Superfund Division
U. S. Environmental Protection Agency, Region 4
61 Forsyth Street, SW
Atlanta, Georgia 30303

Dear Ms. Fulmer and Mr. Pope:

SUBJECT: Action Memorandum and Responsiveness Summary for the Non-Time Critical Removal Action for the D-Area Ash Landfill (488-4D) CERCLIS Number: 63

Pursuant to the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) (40 CFR Section 300.415(b)(2)(iv) of the NCP that states removal actions shall be considered when *"High levels of hazardous substances or pollutants or contaminants in soils largely at or near the surface that might migrate."*, the U.S. Department of Energy (DOE) prepared a Removal Site Evaluation Report/Engineering Evaluation/Cost Analysis (RSER/EE/CA) for the D-Area Ash Landfill (488-4D) (SRNS-RP-2014-00001, Revision 1, June 2014) CERCLIS Number: 63. The regulatory review of the Revision 0 RSER/EE/CA occurred from February 26, 2014 to April 30, 2014. Comments were received from the U.S. Environmental Protection Agency (EPA) on April 30, 2014 and the South Carolina Department of Health and Environmental Control (SCDHEC) on April 23, 2014. On May 30, 2014, the SCDHEC provided two additional comments that were inadvertently omitted from their April 23, 2014 letter. The Savannah River Site's (SRS) responses to EPA's and SCDHEC's comments were incorporated into the Revision 1 RSER/EE/CA, which was made available for public review and comment from June 24, 2014 to July 24, 2014. Comments received during the public comment period are addressed in the enclosed Responsiveness Summary, which will be made part of the Administrative Record. In addition, a notice will be filed in the Environmental Bulletin within two (2) weeks of submittal of the Action Memorandum and Responsiveness Summary to the Administrative Record File/Information Repository File.

The D-Area Operable Unit (DAOU) is one of the area operable units identified at the SRS. DAOU is located in the southwest quadrant of SRS approximately (~) 0.9-kilometers (3,000-feet) east of the nearest site boundary, the Savannah River. The DAOU is ~85 hectares (ha [210 acres {ac}]) and contains surface units and source areas in D Area that potentially pose a threat to human health and the environment. The 488-4D Ash Landfill is a subunit of the DAOU.

ARF-19756

Ms. Susan Fulmer
Mr. Robert Pope

2

AUG 11 2014

The D-Area Powerhouse was built in 1953 and shut down in 2012 after 59 years of operation. The facility burned ~160,000 tons of coal per year during this period. During operation, the powerhouse ash was mixed with water and the slurry was pumped into one of two inlet basins of the 488-1D Ash Basin for settling. Once the ash settled, the dry ash was hauled to the 488-4D Ash Landfill for disposal. As a result of the powerhouse shutdown, operation of the 488-4D Ash Landfill is no longer required.

The 488-4D Ash Landfill is permitted as a Class Two Solid Waste Landfill under Solid Waste Landfill Permit #025800-1602 to accept ash waste for disposal. The location of the 488-4D Ash Landfill is within the DAOU and comprises an area of 6.9 ha (17 ac). All storm water drainage is currently directed into the existing infiltration basin located at the west end of the 488-4D Ash Landfill.

The problems warranting action associated with the coal ash and other materials present within the 488-4D Ash Landfill include the following:

- Arsenic and coal-related radionuclides are historically contaminants of concern in SRS surface ash and may pose a risk for human receptors (future industrial worker risk >1E-06) and ecological receptors.
- There is a potential for migration of contaminants to groundwater for constituents that exceed the regulatory thresholds for a Class Two Solid Waste Landfill.
- Closure of the landfill is required to complete closure of the Solid Waste Landfill Permit #025800-1602.

The removal action objectives for the 488-4D Ash Landfill are:

- Protect future industrial workers and ecological receptors from exposure to arsenic and coal-related radionuclide contaminants to an exposure risk exceeding 1E-06 (or hazard quotient greater than one) in surface ash/soil.
- Prevent migration of potential mobile contaminants to groundwater that could exceed groundwater protection standards.

The preferred removal action for the 488-4D Ash Landfill is Alternative 2, Geosynthetic Cover System, which meets the effectiveness, implementation, cost, and acceptance criteria. The installation of a geosynthetic cover system will comply with SCDHEC Class Three Landfill permeability requirements and provides overall protection to human health and the environment. The geosynthetic cover system will protect groundwater by reducing infiltration into the landfill by rain and storm water and minimize migration of ash contaminants into groundwater. The geosynthetic cover system includes a geosynthetic clay liner (GCL) with a permeability no greater than 1×10^{-5} cm/sec, a geosynthetic drainage layer (GDL), and a vegetative cover consisting of 24 inches of common fill, top soil and vegetation. The ash and other material approved for disposal in the 488-4D Ash Landfill will remain in place under the geosynthetic cover system.

ARF-19756

Ms. Susan Fulmer
Mr. Robert Pope 3 AUG 11 2014

The ash sluice lines that conveyed ash from the powerhouse will be removed as part of this action and disposed of in the 488-1D Ash Basin, 488-4D Ash Landfill and/or an approved disposal facility. Groundwater monitoring and land use controls will be implemented as part of the final remedial action for the D-Area Groundwater Operable Unit and the DAOU, respectively, and is not part of this removal action. A number of groundwater monitoring wells will be abandoned to facilitate construction activities during the removal action and replaced, as necessary, to monitor the effectiveness of the geosynthetic cover system. Materials from the 488-2D Ash Basin (once dewatered), materials from the 489-D Coal Pile Runoff Basin, and pipes/structures/features associated with the landfill operation may be placed in the 488-4D Ash Landfill provided the permitted capacity of the landfill is not exceeded. The final configuration for the storm water management system will consist of a network of perimeter storm drains/structures that gravity drains into the 488-2D Ash Basin. During the construction phase of this action, rain water that accumulates exterior to the current storm water system will be managed as storm water and discharged as necessary.

As part of this removal action, the 488-2D Ash Basin will be converted into a storm water detention structure as a final end state with the basin bottom reconfigured to promote positive drainage from the center of the basin to an outlet structure at each end of the basin. The detention structure will be designed with the intent to drain completely within 72 hours after a 10-year, 24-hour storm event in accordance with SCDHEC storm water regulations. This will require the addition of fill material to the 488-2D Ash Basin bottom. In addition, the 488-2D Ash Basin was permitted as part of an Industrial Wastewater facility (Permit #7295) and this removal action will achieve closure of this facility consistent with the SCDHEC regulations, SC R.61-82, Proper Closeout of Wastewater Treatment Facilities. For the 488-4D Ash Landfill, this removal action will achieve closure consistent with the SCDHEC Class Two Solid Waste Landfill closure requirements, with the geosynthetic cover system meeting the permeability, infiltration and erosion control requirements of the SCDHEC Class Three Solid Waste Landfill closure requirements.

Removal activities are scheduled to commence October 1, 2014. Upon conclusion of the removal action, a Removal Action Report that summarizes the work will be prepared and submitted to document the completion of the removal action.

Questions from you or your staff may be directed to me at (803) 952-8365, or the DOE Federal Project Director, Ms. Karen Adams, at (803) 952-7871.

Sincerely,

Brian T. Hennessey

Dear Ms. Fulmer and Mr. Pope:

SUBJECT: Notification of the Removal Action Start Date for the D-Area Ash Landfill (488-4D) CERCLIS Number: 63

In accordance with the terms of the Federal Facility Agreement (FFA), the U. S. Department of Energy (DOE) is notifying the South Carolina Department of Health and Environmental Control (SCDHEC) and the U. S. Environmental Protection Agency (EPA) that the Removal Action Start for the D-Area Ash Landfill (488-4D) was met on September 02, 2014, ahead of the FFA milestone date of October 01, 2014. The removal action start date was met with the abandonment of the approved groundwater monitoring wells located within the facility boundary. Other removal action activities underway include the mobilization efforts for the removal of the ash sluice line, the survey of the borrow source area on the Savannah River Site, and the mobilization and sampling of the clean fill borrow materials to ensure the soils meet the requirements outlined in the Removal Action Design Plan for the 488-4D Ash Landfill and 488-2D Ash Basin (SRNS-RP-2014-00459).

The effort and time that the SCDHEC and the EPA have given on the subject operable unit are greatly appreciated. Questions from you or your staff may be directed to me at (803) 952-8365, or the DOE Federal Project Director, Ms. Karen Adams, at (803) 952-7871.

Sincerely,

Brian T. Hennessey

Mr. Robert H. Pope
Savannah River Site Remedial Project Manager
Superfund Division
U. S. Environmental Protection Agency, Region 4
61 Forsyth Street, SW
Atlanta, Georgia 30303

Dear Ms. Fulmer and Mr. Pope:

SUBJECT: Action Memorandum for the Time Critical Removal Action for the D-Area Ash Basin (488-2D) and the Removal Site Evaluation Report for the D-Area Ash Basin (488-2D) (SRNS-RP-2013-00825, Revision 1, ~~August~~ September 2014) CERCLIS Number: 63

Pursuant to the National Oil and Hazardous Substances Pollution Contingency Plan (NCP) (40 CFR Section 300.415(b)(2)), the U.S. Department of Energy (USDOE) prepared the attached Removal Site Evaluation Report (RSER) for the D-Area Ash Basin (488-2D) (SRNS-RP-2013-00825, Revision 1, ~~August~~ September 2014) in order to perform a time-critical removal action. USDOE, as lead agency, is mandated to take action to reduce the adverse effects of contamination per the guidance listed in 40 CFR Section 300.415(b)(2). The USDOE, U.S. Environmental Protection Agency (USEPA) and South Carolina Department of Health and Environmental Control (SCDHEC) have agreed that the coal ash sediments present within the 488-2D Ash Basin bottom warrants a removal action to reduce the risk to human health and the environment due to the potential for a containment failure and subsequent exposure to the elevated levels of arsenic and naturally-occurring, coal-related radionuclides in the ash. These site conditions meet the criteria in 40 CFR Section 300.415(b)(2)(i) and (v): *"Actual or potential exposure to nearby human populations, animals, or the food chain from hazardous substances or pollutants or contaminants;"* and *"Weather conditions that may cause hazardous substances or pollutants or contaminants to migrate or be released;"*.

The SCDHEC and the USEPA provided comments on the Revision 0 RSER in their letters dated March 5, 2014 and March 12, 2014, respectively. The Revision 1 RSER incorporated the responses to the regulatory comments, as applicable, and is included as an enclosure to this Action Memorandum. This Action Memorandum and the RSER, which details how the time-critical removal action is being completed, are scheduled to be issued for the thirty-day public review and comment during the week of November 10, 2014. This Action Memorandum, the RSER, and the notice to the public will be made part of the Administrative Record.

ARF-19848

OCT 2 8 2014

Ms. Susan Fulmer
Mr. Robert Pope 2

The D-Area Operable Unit (DAOU) is one of the area operable units identified at the Savannah River Site (SRS). The 488-2D Ash Basin is a subunit of the DAOU, which is located in the southwest quadrant of SRS approximately 0.9-km (3,000-feet [ft]) east of the nearest site boundary, the Savannah River. The DAOU is approximately 85 hectares (ha [210 acres {ac}]) and contains surface units and source areas in D Area that potentially pose a threat to human health and the environment.

The D-Area Powerhouse was built in 1953 and was shut down in 2012. As a result of the shutdown of the powerhouse, continued operation of the 488-1D and 488-2D Ash Basins, and the 488-4D Ash Landfill, are no longer required to support power generation. During operation, the powerhouse ash was mixed with water to form a slurry that was piped into one of two inlet basins located at the east of the 488-1D Ash Basin. The ash would settle out in the inlet basins and the wastewater would flow into the east end of the 488-1D Ash Basin and then into the 488-2D Ash Basin. Over time, ash fines settled out of the retained water in the 488-2D Ash Basin and accumulated on the basin bottom. When the water level rose in the 488-2D Ash Basin, it discharged into National Pollutant Discharge Elimination System (NPDES) Outfall D-01C, and eventually into Outfall D-01 and Beaver Dam Creek. Approximately 0.6 meters (m [2 ft]) of ash are estimated to be in the bottom of the 488-2D Ash Basin. In 2011, the USDOE, USEPA, and SCDHEC agreed to add the 488-1D Ash Basin, 488-2D Ash Basin, and the 488-4D Ash Landfill to the Federal Facility Agreement as subunits of the DAOU.

Since the early 1980's, the following documented structural repairs/modifications to the exterior western and southern berms of both the 488-1D and 488-2D Ash Basins have been necessary due to well defined areas of stress in the berms and in some cases, failure of the berm:

- 488-2D Berm Side Slope Modification – modifications/repairs to the west berm in 1981.
- 488-1D Berm Failure Area Repair – repair of +/- 30 m (100 ft) of the west berm in 1980.
- 488-1D Berm Stress Area Repair – repair of +/- 46 m (150 ft) of the west berm in 1980.
- 488-1D Retention Dike Repair – installation of 533 m (1,750 ft) of toe drain and a manhole at the base of the berm (west and south berm) in 1989.

Berm failures and stressed areas represent a safety threat to workers and possible trespassers, and a potential impact to the environment. The probability for berm failure increases with time due to the saturation of the ground, the original design of the berms (i.e., materials of construction, elevations, etc.) and the steep slope (2:1) of the berms. Extreme weather conditions may facilitate such a failure.

Based on previous remedial investigations at other SRS ash basins, it is known that coal ash typically contains toxic metals such as arsenic, and naturally-occurring radionuclides. Based on this historical information, SRS has concluded that the ash within the 488-2D Ash Basin contains unacceptable levels of these contaminants. The concentrations of the metals, arsenic in particular (64.3 mg/kg), and the coal related radionuclides represent a potential risk to human health and the environment should exposure occur through a containment (berm) failure that allows release of these contaminants into the surrounding environment.

ARF-19848

OCT 2 8 2014

Ms. Susan Fulmer
Mr. Robert Pope

3

As a result, the problems warranting action associated with the 488-2D Ash Basin are as follows:

- Arsenic and naturally-occurring, coal-related radionuclides are historically human health (HH) constituents of concern in SRS surface ash and may pose a risk for human receptors (future industrial worker risk >1E-06) and ecological receptors.
- There is a potential for migration of contaminants to groundwater above groundwater protection standards due to the uncertainty in groundwater elevation and flow path changes over time.
- Closure of the basin is necessary to complete closure of the Industrial Wastewater Treatment (IWT) Permit #7295.

The ash removal of the 488-2D Ash Basin is essential to reduce the risk to HH and the environment and to maintain the current DAOU closure/construction schedule. Closure of this facility is necessary to limit the potential for eventual berm failure. Specifically, the objective of this time-critical removal action is as follows:

- Excavate the contaminated media (ash) in the 488-2D Ash Basin and place the media into either the 488-1D Ash Basin or the 488-4D Ash Landfill. The placed ash will remain in 488-1D or 488-4D for final disposal since both the 488-1D Ash Basin and 488-4D Ash Landfill will be closed under separate Comprehensive Environmental Response, Compensation, and Liability Act actions. The extent of the removal will be based on visual inspection and confirmation sampling. Confirmation sampling to verify ash removal will be performed and evaluated in accordance with the approved *Confirmation Sampling and Analysis Plan for Coal and/or Ash Removal at the Savannah River Site (U)*. The final remedial decision for the 488-2D Ash Basin will be described in the second DAOU Early Action Record of Decision.

Dewatering of the 488-2D Ash Basin to facilitate the ash removal is outside the scope of this removal action. Although the dewatering of the 488-2D Ash Basin is not the focus of this removal action, it is an essential activity that is required before any excavation of ash can take place. This water will be removed/managed in accordance with the current NPDES permit and/or transferred within the existing IWT permitted basin complex (i.e., 488-1D Ash Basin, or the 488-1D Inlet Basins). No other contaminated media will be addressed in this removal action.

ARF-19848

OCT 2 8 2014

Ms. Susan Fulmer
Mr. Robert Pope 4

This removal action is expected to commence in October 2014. Upon conclusion of the removal action, a Removal Action Report that summarizes the work will be prepared and submitted to document the completion of the removal action. Questions from you or your staff may be directed to me at (803) 952-8365, or the USDOE Federal Project Director, Ms. Karen Adams, at (803) 952-7871.

Sincerely,

Brian T. Hennessey
SRS Remedial Project Manager

Dear Ms. Fulmer and Mr. Pope:

SUBJECT: Removal Action Design Plan (RADP) for the 488-4D Ash Landfill and 488-2D Ash Basin (SRNS-RP-2014-00459, Revision 1.1, March 2015) (Redline Pages and Professional Engineer Stamped Clean Copy), Savannah River Site (SRS) Responses to the Regulatory Comments on the Revision 1 RADP, SRS Responses to the Regulatory Comments on the White Paper on the Hydrologic Evaluation of Landfill Performance (HELP) Model Evaluation for the 488-4D Ash Landfill Cover System (ERD-EN-2014-0049, Revision 0, December 2014), and SRS Responses to the Regulatory Comments on the White Paper on the Source of Groundwater Contamination and the Hydrologic Separation Study for the D-Area Ash Basins and Ash Landfill (ERD-EN-2014-0025, Revision 0, August 2014) CERCLIS Number: 63

The U.S. Department of Energy (DOE) is submitting the enclosed redline pages and Professional Engineer (PE) Stamped Removal Action Design Plan (RADP) for the 488-4D Landfill and 488-2D Ash Basin for your review. The South Carolina Department of Health and Environmental Control (SCDHEC) and the U. S. Environmental Protection Agency (EPA) provided comments on the Revision 1 RADP and the two white papers (ERD-EN-2014-0049 and ERD-EN-2014-0025) on January 15, 2015 and January 20, 2015, respectively. The SRS electronically transmitted draft comment responses on February 25, 2015. Based on regulatory feedback from the draft comment responses, all comments have been sufficiently addressed and the RADP has been revised to incorporate the responses. The two white papers did not require any changes as a result of the comment responses. Final copies of the comment responses are enclosed.

Please review the enclosures and provide your concurrence within thirty (30) days of receipt. The effort and time that the SCDHEC and the EPA have given on the subject operable unit are greatly appreciated.

Mr. Robert H. Pope
Savannah River Site Remedial Project Manager
Superfund Division
U. S. Environmental Protection Agency, Region 4
61 Forsyth Street, SW
Atlanta, Georgia 30303

Dear Ms. Fulmer and Mr. Pope:

SUBJECT: November 2016 Completion Status of the D-Area Ash Basin Project, CERCLIS Number: 63

The U.S. Department of Energy (DOE) is submitting this letter to document the status and completion of various construction activities in accordance with the selected removal actions defined in the following documents:

- *Removal Site Evaluation Report (RSER) for the D-Area Ash Basin (488-2D) (U)* (SRNS-RP-2013-00825, Revision 1, September 2014) CERCLIS Number: 63
- *Removal Site Evaluation Report / Engineering Evaluation / Cost Analysis (RSER/EE/CA) for the D-Area Ash Landfill (488-4D) (U)* (SRNS-RP-2014-00001, Revision 1, June 2014) CERCLIS Number: 63
- *Removal Site Evaluation Report / Engineering Evaluation / Cost Analysis (RSER/EE/CA) for the D-Area Ash Basin (488-1D) (U)* (SRNS-RP-2015-00490, Revision 1, June 2016) CERCLIS Number: 63
- *Revision 3 Action Memorandum for the Non-Time Critical Removal Action for the D-Area Coal Pile Runoff Basin (489-D), CERCLIS Number: 63* (IACD-15-168, dated August 11, 2015)

To observe the status and completion of these construction activities, a field visit by DOE, South Carolina Department of Health and Environmental Control (SCDHEC), and U.S. Environmental Protection Agency (EPA) personnel (Enclosure 1) was conducted on November 3, 2016. Savannah River Nuclear Solutions, LLC (SRNS) personnel participated in the field visit (Enclosure 1) to lead the tour and discussions. The personnel present observed and discussed the construction activities within the 488-2D Ash Basin, the 488-4D Ash Landfill, the 488-1D Ash Basin, the 489-D Coal Pile Runoff Basin, and the new borrow pit. To assist in the discussions, the handouts included as Enclosure 2 were provided to all individuals present. Highlights from the field visit are provided below.

ARF-020897

Ms. Susan Fulmer
Mr. Robert Pope 2 NOV 22 2016

488-4D ASH LANDFILL

- All ash within the scope of the 488-2D and 488-4D RSER/EE/CA has been consolidated and placed within 488-4D Ash Landfill. No additional ash will be placed within this permitted facility and it is closed for any further waste disposal.
- All construction activities for the installation of the SCDHEC Class Three Landfill cover have been completed for this landfill per the *Removal Action Design Plan (RADP) for the 488-4D Ash Landfill and 488-2D Ash Basin (U)* (SRNS-RP-2014-00459, Revision 1.1, March 2015) CERCLIS Number: 63.
- The location of the four groundwater monitoring wells (one up gradient and three down gradient) were identified along with the schedule for installation. Installation is scheduled to begin in 4QCY2016.
- The SCDHEC Bureau of Land and Waste Management (Justin Koon) and other participants observed the subgrade design within the active storm sewer manhole located off the northeast corner of 488-4D Ash Landfill to confirm proper installation.
- The removal action for the 488-4D Ash Landfill is complete. The Removal Action Report for the 488-2D Ash Basin and the 488-4D Ash Landfill (Revision 0) is scheduled to be submitted by March 30, 2017.

488-2D ASH BASIN

- Ash within the 488-2D Ash Basin bottom has been completely removed from the basin.
- Confirmatory sampling has been completed and all data has been incorporated into the *Human Health and Ecological Evaluation for Confirmation Sampling at the 488-2D Ash Basin (U)* (ERD-EN-2015-0053, Revision 1, October 2016) CERCLIS Number: 63.
- Soil cover and sod installation have been completed per the *Removal Action Design Plan (RADP) for the 488-4D Ash Landfill and 488-2D Ash Basin (U)* (SRNS-RP-2014-00459, Revision 1.1, March 2015) CERCLIS Number: 63. The 488-2D Ash Basin now functions as a detention basin.
- Sediment control floats will remain on the discharge structures throughout the 488-1D Ash Basin construction project. Floats will be removed upon completion of the 488-1D Ash Basin project.
- The removal action for the 488-2D Ash Basin is complete. The Removal Action Report for the 488-2D Ash Basin and the 488-4D Ash Landfill (Revision 0) is scheduled to be submitted by March 30, 2017.

488-1D ASH BASIN

- Removal of vegetative cover is progressing rapidly. All root balls containing ash are being managed as CERCLA waste and are being disposed at Three Rivers Landfill. All overburden vegetation free of ash is being chipped/slashed and relocated off the construction site.
- The 489-D Coal Pile Runoff coal residue and soils have been relocated into the 488-1D Ash Basin.
- Excavation of the ash located along the west end of the landfill has been initiated to design drainage channels within this area of the basin.
- Basin is relatively free of standing water.
- Collected storm water within the North Inlet Basin is being used for irrigation purposes on the 488-D Ash Basin and 488-4D Ash Basin covers.

ARF-020897

Ms. Susan Fulmer
Mr. Robert Pope

3

NOV 22 2016

489-D COAL PILE RUNOFF BASIN

- All coal fines have been removed from the basin bottom. The majority of the coal fines have been transported to the 488-1D Ash Basin. One small pile remains within the basin area to be transported to 488-1D Ash Basin in the very near future.
- Twelve inches of under burden soil has been stripped from the basin bottom and is in the process of being placed within the 488-1D Ash Basin. Some soil piles remained at the time of the November 3, 2016 tour.
- Non-hazardous waste determination has been completed for all material within this basin based on sample results in conjunction with process knowledge. No material within this basin is determined to be characteristically hazardous.
- Confirmation sampling has been initiated for this basin. Additional sampling will be necessary to confirm the absence of the coal residue in the areas of the stock piled soils/coal residues. Back filling to final grade and sodding will occur upon removal of all excavated basin bottoms.
- With the removal of the coal residues and the twelve inches of under burden soils, current storm water management compliance will shift from the National Pollutant Discharge Elimination System General Permit for Storm Water Discharges Associated with Industrial Activities (Except Construction), SCR000000, Section 1.1.2 (Runoff from coal storage piles at steam electric generating facilities) to the compliance requirements defined within the project specific Storm Water Pollution Prevention Plan (SWPPP). All water will be pumped through a SWPPP Best Management Practice and discharged to the D-Area Discharge Canal.

Based on this review and walk down, the DOE, SCDHEC, and EPA personnel present agreed that there were no deficiencies observed with the completed field activities for the completed removal actions associated with 488-4D Ash Landfill and 488-2D Ash Basin. In addition, these personnel also agreed that construction activities associated with the removal actions specific to the 488-1D Ash Basin and the 489-D Coal Pile Runoff Basin are progressing satisfactorily.

Questions from you or your staff may be directed to me at (803) 952-8365, or the DOE Federal Project Director, Ms. Karen Adams, at (803) 952-7871.

Sincerely,

Brian T. Hennessey

Subject: OSR Determination for Three Rivers Landfill, Aiken, SC (024202-1101)

Hello Paula,

Hope you are doing well and had a great Thanksgiving. As the holiday season is approaching I thought would ask for approval a week earlier than normal.

I am with the contractor at the Savannah River Site, a Department of Energy facility in Aiken, SC that is listed on the NPL. It is time for another CERCLA OSR approval for the Three Rivers Landfill. Could I please have a current CERCLA Offsite acceptability determination for Three Rivers Landfill, Aiken, SC (024202-1101)?

Thank you very much and hope you have a Merry Christmas and safe and Happy New Year.

Hello Paula,

I am with the contractor at the Savannah River Site, a Department of Energy facility in Aiken, SC that is listed on the NPL. It is time for another CERCLA OSR approval for the Three Rivers Landfill. Could I

please have a current CERCLA Offsite acceptability determination for Three Rivers Landfill, Aiken, SC (024202-1101)?

Good Morning Michele,

So far the summer has been lovely and hot. I expected higher temperatures longer, but we got just a week of 99+, so I can't complain. I hope everyone's summer has comfortable and active.

Three Rivers Landfill (024202-1101), Aiken, South Carolina is acceptable to receive waste regulated by the CERCLA Off-Site Rule. The EPA advises you to contact us within 60 days to check for continued acceptability.

Subject: OSR determination for Three Rivers Landfill, Aiken, SC (024202-1101)

Hello Paula,

Hope you are enjoying the very warm winter weather. All of my spring daffodils and tulips are starting to come up now, so it will probably freeze soon.

It is time for another CERCLA OSR approval for the Three Rivers Landfill in Aiken, South Carolina.

Could I please have a current CERCLA Offsite acceptability determination for Three Rivers Landfill, Aiken, SC (024202-1101)?

Michele P. Wilson

Good Afternoon Michele,

Belated Happy Thanksgiving to you!! Yes my holiday was good and quiet just like I wanted it. Hoping yours was equally as peacefully. And with the upcoming "Holidays" it's about to be slightly nutsy. Hope you keep your peace and joy about you in these times. Merry Christmas and Happy Holidays!!

Three Rivers Landfill (024202-1101), Aiken, South Carolina is acceptable to receive waste regulated by the CERCLA Off-Site Rule. The EPA advises you to contact us within 60 days to check for continued acceptability.

Thanks,

Paula A Whiting

Approval to Add Materials in Order to Dry Waste
RE: Request to Use Drying Agent dated December 9, 2015
488-4D Class 2 Landfill – Permit #025800-1602
Aiken County

Dear Mr. Morris:

The Department received your request to add either cement and/or lime into your waste stream in order to dry the material prior to placement within the landfill dated December 9, 2015. By adding the drying agent, the facility hopes to improve the compaction of the ash which should ensure the stability of the cover and minimize subsidence. After careful review, the Department approves the request to add the requested drying agents since these materials meet the Class 2 Landfill standards and the potential benefits stated above. If any other drying agent is to be used, another request to the Department must be made. Please keep a copy of this letter with your other permit documents at the facility.

If you have any questions regarding this approval, please contact Justin Koon at (803) 898-1339 or by email at koonjt@dhec.sc.gov.

Sincerely,

Joan F. Litton, Manager

Approval of Minor Modification

RE: Detail Drawings Received October 14, 2015
488-4D Class 2 Landfill – Permit #025800-1602
Aiken County

Dear Mr. Morris:

The Department received an update to Design Drawing SK-EC&ACP-DAOU-00005 that shows modifications to the tie-in of the liner system into 488-D and to the subsurface drainage for the 488-4D Class 2 Landfill on October 14, 2015. After careful review, the Department approves the modifications. A copy of this letter and the attached drawing should be kept with the other permit documents for this facility.

If you have any questions regarding this permit, please contact Justin Koon at (803) 898-1339. General questions and future correspondence pertaining to the operation and compliance of the referenced facility should be referred to the Midlands Region EQC office in Aiken at (803) 642-1637.

Sincerely,

Kent M. Coleman

NORTHWIND SITE SERVICES

April 13th, 2016

Andrew White, PMP
Project Manager
Envirocon, Inc.
101 International Drive
Missoula, MT 59808

SUBJECT: Field Engineer Certification

Project: SRNS 488-4D Ash Landfill Closure

As an employee of North Wind Site Services, LLC, I was subcontracted by Envirocon, Inc. to serve as the Field Engineer, for the above referenced project, in charge of verifying all construction activities, inspections, and testing were performed in accordance with the contract specifications. I observed the construction activities, geotechnical and materials inspections, stormwater inspections, fill placement and compaction activities, and disposal activities.

Based on the observations of the construction and on my review of all testing and inspection reports, I hereby certify that all construction activities performed in association with the landfill closure have been completed in accordance with the contract specifications up through Tuesday, March 8th, 2016.

Sincerely,

Morgan Campbell Crace, P.E.

To: **Donald Baston**
SRNS Civil Lead

From: **Raymond Scott Ribes**
Envirocon Field Engineer

Subject: **Field Engineer Certification**
Project SRNS 488-4D Ash Landfill Closure

As an employee of Aerotek, I was subcontracted by Envirocon, Inc. to serve as the Field Engineer, for the above referenced project, in charge of verifying all construction activities, inspections, and testing were performed in accordance with the contract specifications. I observed the construction activities, geotechnical and materials inspections, storm water inspections, surveying, fill placement and compaction reports, liner installation, and sod installation.

Based on these observations of the construction and on my review of all testing and inspection reports, I hereby certify that all construction activities performed in association with the landfill closure have been completed in accordance with the contract specifications and drawings. I am certifying all construction activities from Tuesday, March 8, 2016 to completion of the project.

Morgan C Crace, P.E. was the field engineer from the start of the project to March 8, 2016. He has certified the construction activities for that time period. Mr. Crace certification letter, dated April 13, 2016 is attached.

Sincerely,

Raymond Scott Ribes

APPENDIX M

DAOU FILL MATERIAL AND TOPSOIL EVALUATION

This page intentionally left blank.

APPENDIX M

D-Area Operable Unit Fill Material and Top Soil Evaluation

This page intentionally left blank.

D-Area Operable Unit Fill Material and Top Soil Evaluation

Soil samples were collected from two source areas and evaluated per the requirements of the *SRS Fill and Soil Cover Material Verification Protocol* (WSRC 2003). These two areas are the Common Fill Borrow Site located near D Area at the Savannah River Site (SRS), and the Jackson Stockpile located outside the SRS boundary in Jackson, South Carolina. The soil was used as fill material and/or top soil for the 488-2D Ash Bash and the 488-4D Ash Landfill. This evaluation concludes that the soil from both of these source areas meets the requirements for use as fill material / top soil at the D-Area Operable Unit (DAOU) under an unrestricted (residential) land use scenario.

Sample Collection and Analysis

Samples were collected and analyzed in accordance with the testing requirements for common fill and top soil that are outlined in the *Removal Action Design Plan (RADP) for the 488-4D Ash Landfill and the 488-2D Ash Basin (U)* (SRNS 2015). Soil from the Common Fill Borrow Site that was used as fill material was sampled at an initial rate of one composite sample every 765 m^3 (1,000 yd^3) for the first 11,468 m^3 (15,000 yd^3); once this material was demonstrated to be acceptable, both by concentration and spatial distribution, representative samples were collected at a rate of one composite sample every 11,468 m^3 (15,000 yd^3) thereafter. Top soil obtained from both the Common Fill Borrow Site and the Jackson Stockpile was sampled at an initial rate of one composite sample every 765 m^3 (1,000 yd^3) for the first 7,646 m^3 (10,000 yd^3); once this material was demonstrated to be acceptable, both by concentration and spatial distribution, representative samples were collected at a rate of one composite sample every 1,911 m^3 (2,500 yd^3) thereafter.

Each composite sample consisted of five sub-samples from the source. Each sub-sample taken from the working face of the pile consisted of representative soil taken for the entire vertical extent. The soil samples were analyzed for target analyte list, target compound list, gross alpha and non-volatile beta; samples exceeding the 20 pCi/g gross alpha and/or 50 pCi/g non-volatile beta screening limits triggered additional isotopic analysis.

Data Evaluation Method

The maximum detected concentration of each constituent was compared to the default residential soil values from the *USEPA Regional Screening Levels (RSLs)* website, dated May 2016 (USEPA 2016) for nonradiological constituents, and site-specific residential values obtained from the *USEPA Preliminary Remedial Goals (PRGs) for Radionuclides* website, dated November 2014 for radiological constituents. Constituents with maximum detected concentrations that exceeded these risk-based thresholds were then compared to the SRS background soil 95th percentile concentration identified in the *Background Soils Statistical Summary Report for the Savannah River Site* (WSRC 2006). Constituents that did not exceed these preliminary screening criteria met the acceptance criteria and were dropped from further evaluation; constituents that did not meet the preliminary screening criteria were further evaluated in an uncertainty discussion. The preliminary screening criteria are the same for fill material and top soil.

Data Evaluation Results for the Common Fill Borrow Site

The location of the Common Fill Borrow Site located near D Area at SRS is shown in Figure 1. A total of 64 samples (samples DAABFILL01 through DAABFILL64) were collected from this source; Figure 2 is a map of the sample locations. All detected results, sorted by ANALYTE from high concentration to low concentration, are provided as an attachment (Table 1, Attachment 1). All analytical results, including nondetects, sorted by STATION ID, are provided in an attachment (Table 1, Attachment 2).

The preliminary data evaluation is shown in Table 1. The maximum detected concentration of five constituents exceeded the residential RSL/PRG threshold (arsenic, chromium, radium-226[+D], thorium-232[+D], and uranium-238[+D]). The concentration of these constituents was then compared to the SRS background soil 95th percentile concentration (WSRC 2006). None of these constituent concentrations exceeded the background comparison, and further evaluation in an uncertainty discussion is not warranted. This soil meets the requirements for use as fill material / top soil at DAOU under an unrestricted (residential) land use scenario.

Data Evaluation Results for the Jackson Stockpile

The location of the Jackson Stockpile in Jackson, SC is shown in Figure 3. A total of 15 samples (samples DAAB TS01 through DAAB TS-15) were collected from this source; Figure 4 is a map of the sample locations. All detected results, sorted by ANALYTE from high concentration to low concentration, are provided as an attachment (Table 2, Attachment 1. All analytical results, including nondetects, sorted by STATION ID, are provided in an attachment (Table 2, Attachment 2).

The preliminary data evaluation is shown in Table 2. Arsenic and chromium were the only constituent concentrations that exceeded the residential RSL/PRG threshold; the concentration of these constituents was then compared to the SRS background soil 95th percentile concentration (WSRC 2006). The maximum detected concentration of arsenic did not exceed the background concentration and meets the clean fill criteria. However, the maximum detected concentration of chromium is slightly greater than the SRS 95th percentile concentration and further evaluation is provided below for this constituent.

Total chromium concentrations ranged from 4.32 mg/kg to 34.3 mg/kg with a mean concentration of 7.04 mg/kg. Sample location DAAB-TS-04 had the highest detected concentration. The next highest concentration of 10.4 mg/kg occurred at DAAB-TS-14.

Maximum concentration in SRS background soils is 54.3 mg/kg and the mean concentration is 11.4 mg/kg. The Jackson Stockpile total chromium concentrations are within (i.e., lower than) the concentrations found in SRS background soil. Chromium is a naturally-occurring constituent that is ubiquitous in SRS soils.

Chromium occurs in the environment primarily in two valence states, trivalent chromium (Cr^{+3}), and hexavalent chromium (Cr^{+6}). Exposure may occur from natural or industrial sources of chromium. Trivalent chromium is much less toxic than hexavalent chromium- the trivalent form is considered noncancerous, whereas the hexavalent form is considered cancerous. Chromium compounds, in the Cr^{+3} or Cr^{+6} forms, are used for chrome plating, the manufacture of dyes and pigments, and leather and wood preservation. The USEPA recommends that valence-specific state data for chromium be collected when chromium is likely to be an important contaminant at

the site. Since this is not the case at this location (i.e., chromium not a significant contaminant or risk driver), the valence state of chromium was not determined- the chemical analysis was for total chromium.

The data screening presented in Table 2 used the Cr^{+6} RSL of 0.30 mg/kg to perform the preliminary evaluation. This conservative approach tends to bias the evaluation, since it is likely that the trivalent form of chromium is most prevalent at the site. The RSL for Cr^{+3} is 120,000 mg/kg for the residential exposure scenario.

Chromium meets the criteria for unrestricted land used based on the following lines-of-evidence:

- Unit concentrations are within the SRS background soil concentration range.
- It is a naturally-occurring constituent that is common in SRS background soils.
- The valence state of chromium was not determined- analytical result was for total chromium. Preliminary data screening is biased (high) because the most conservative RSL (Cr^{+6}) was used, but this form is not expected to be present. The unit maximum concentration is below residential RSL values for Cr^{+3}, the most likely form of chromium at this location.

Conclusion

This evaluation concludes that the soil from the Common Fill Borrow Site and the Jackson Stockpile meets the requirements for use as fill material / top soil at the DAOU under an unrestricted (residential) land use scenario.

DAABFILL16	Uranium-238(+D)	0.902	pCi/g		0.798	YES	1.2175	NO	YES

1. Analytes detected from samples DAABFILL01 through DAABFILL64 (64 total).
2. Maximum detected concentration from samples DAABFILL01 through DAABFILL64.
3. Residential RSLs from *USEPA Regional Screening Levels* table, dated May 2016. Residential PRGs are site-specific values derived using the *USEPA Radionuclide Preliminary Remediation Goals for Superfund* website calculator and eliminating the fruit and vegetable consumption pathways. All other inputs are default parameters.
4. SRS 95th percentile concentration obtained from the *Background Soils Statistical Summary Report for Savannah River Site*, ERD-EN-2005-0223, Rev.1, Appendix B-2.
5. Clean fill criteria described in Technical Memorandum *SRS Fill and Cover Material Verification Protocol (U)*, ERTEC-2003-00012, December 18, 2003.
6. EN = essential nutrient; RSL is not available for this constituent.
7. NA = not applicable: radium-228 and thorium-228 are daughter products of thorium-232. In the absence of a reported result for thorium-232, the activities of these daughter products can be used to estimate the activity of thorium-232 since these constituents are in secular equilibrium. The thorium-232(+D) PRG is then used in the screening comparison. A separate screen for radium-228 and thorium-228 is not performed since these are considered in the thorium-232(+D) PRG calculation.

Table 2. D-Area Fill Material/Top Soil Evaluation For Jackson Stockpile — Samples DAAB-TS-01 Through DAAB-TS-15

Station ID	Analyte[1]	Maximum Result[2]	Units	Lab Qualifier	Residential RSL[3]	Max Result > RSL?	SRS 95th %tile[4]	Max Result > SRS 95th %tile?	Meets Clean Fill Criteria?[5]
Inorganics									
DAAB-TS-04	Arsenic	3.8	mg/kg		0.68	YES	8.2	NO	YES
DAAB-TS-04	Beryllium	0.356	mg/kg	J	160	NO			YES
DAAB-TS-04	Chromium	34.3	mg/kg		0.3	YES	29.92	YES	NO[6]
DAAB-TS-10	Copper	2.9	mg/kg		3,100	NO			YES
DAAB-TS-13	Cyanide	0.169	mg/kg	J	23	NO			YES
DAAB-TS-13	Lead	6.31	mg/kg		400	NO			YES
DAAB-TS-10	Mercury	0.0209	mg/kg		11	NO			YES
DAAB-TS-06	Nickel	1.26	mg/kg		1,500	NO			YES
DAAB-TS-07	Zinc	8.18	mg/kg		23,000	NO			YES
Organics									
DAAB-TS-06	Acetone	0.0104	mg/kg		61,000	NO			YES
DAAB-TS-03	M,P-Xylene	0.00115	mg/kg	J	550	NO			YES
DAAB-TS-08	Methyl Tertiary Butyl Ether (MTBE)	0.000584	mg/kg	J	47	NO			YES
Pesticides/PCBs									
DAAB-TS-14	Aroclor 1254	0.00562	mg/kg		0.24	NO			YES

1. Analytes detected from samples DAAB-TS-01 through DAAB-TS-15 (15 total).
2. Maximum detected concentration from samples DAAB-TS-01 through DAAB-TS-15.
3. Residential RSLs from *USEPA Regional Screening Levels* table, dated May 2016.
4. SRS 95th percentile concentration obtained from the *Background Soils Statistical Summary Report for Savannah River Site*, ERD-EN-2005-0223, Rev.1, Appendix B-2.
5. Clean fill criteria described in Technical Memorandum *SRS Fill and Cover Material Verification Protocol (U)*, ERTEC-2003-00012, December 18, 2003.
6. RSL for hexavalent chromium used in evaluation. Residential RSL for trivalent chromium (120,000 mg/kg) is not exceeded in any samples. Maximum detection of chromium at location DAAB-TS-04 (34.3 mg/kg) is greater than SRS 95th%tile but less than the SRS maximum concentration of 54.3 mg/kg. Further evaluation is provided in the text.
