**Reading Room: Lower Three Runs Remedial Action Fact Sheet**

Please make the above documents available to the general public for a minimum of Thirty (30) days for public comment beginning on February 2, 2023, after which they may be discarded.

Please acknowledge receipt of the document by email to [Dexter.McDaniel@srs.gov](mailto:Dexter.McDaniel@srs.gov). If you have any questions, please call me at (803) 952-7401 or e-mail me at the above address.

Sincerely,

A handwritten signature in black ink, appearing to read "Dexter McDaniel", is written over a faint, illegible typed name.

Dexter McDaniel  
EC & ACP Records  
730-4B, Room 135

## **Definitions:**

Each entry in this Administrative Record File contains the following information:

**ARF/IRF Catalog Number:** A unique number assigned to each document or piece of information. This number appears in the upper right hand corner of the document.

**Date:** The date the document or information was issued.

**Document Number:** Many of the documents published or produced by SCDHEC, EPA and SRS are assigned unique numbers. If no document number has been assigned, the Catalog Number is used.

**Title:** The title of the document, or a brief description of the contents.

**Author:** The person or party responsible for the issuance or writing of the document or information.

**Author Affiliation:** The organization that the author works for or is affiliated with.

**Addressee:** In most cases this entry will be blank except if the document is correspondence. The entry in that case will be the organization(s) to which the Addressee is affiliated.

**Appx. No. of Pages:** The approximate number of pages the document contains.

**Classification:** The entry will contain one of the two following codes.

**U:** The information is unclassified and available to the general public for viewing.

**CP:** The information or document is considered confidential or privileged. The document may contain sensitive information and is not available to the general public. It may be included in an Administrative Record File as it was used to support the decision making, but cannot be made publicly available.

**File Type:** One of the following codes will be entered in this area:

**ARF:** This document is included in the Administrative Record File.or Administrative Record for the unit. The document is physically located either in hard copy or on cd and is available to the general public for viewing and/or copying.

**ARF-BRO:** This document is included in the Administrative Record File or Administrative Record for the unit. The document will not be on cd because it is classified or privileged information, protected by copy-right laws, or is publicly available technical literature not generated for the unit at issue (i.e.; an engineering textbook).

**IRF:** This document is provided for information only. It is not used in the decision making process for the unit. It is physically located either in hardcopy or on cd and is available to the general public for viewing and/or copying.

**IRF-BRO:** This document is listed for information only. It was not used in the decision making process for the unit. It will not be microfilmed because it is protected by copyright laws or is publicly available.

**Compact Disk (CD) Number:** A typical entry is 101. The document associated with that catalog number is located on that cd in pdf format.

**APPENDIX A**

**FACT SHEET**

**This page was intentionally left blank.**

**Remedial Action Lower Three Runs (LTR)  
Integrator Operable Unit (IOU)  
Upper Subunit**

**Location**

The LTR watershed is located in the southeastern portion of Savannah River Site (SRS). LTR is a large blackwater stream that originates in the northeast portion of SRS and follows a southerly direction for approximately >40 kilometers (km [24.5 miles {mi}]), discharging into the Savannah River. The LTR IOU consists of an Upper, Middle, and Lower subunit. The Upper subunit is located upgradient of the PAR Pond Dam and includes PAR Pond and the pre-cooler ponds and canal system. The Upper subunit is the subject of this Remedial Action Implementation Plan.

**History**

Residual sediment/soil contamination is present in the LTR IOU stream corridor due to historical reactor operations. R-Reactor began operations in 1953 and was followed by P-Reactor in 1954. Both reactors received cooling water from the Savannah River via the river water distribution system. For purposes of investigation, the stream corridor in the Upper subunit was segregated into the following nine individual Exposure Areas (EAs):

- EA1: Pond A – Including R-Area Discharge Canal
- EA2: Canal from Pond A to Pond B
- EA3: Pond B – Including canal to Pond C
- EA4: Canal from Pond B to North Arm of PAR Pond
- EA5: Joyce Branch (Old Discharge Canal)
- EA6: PAR Pond
- EA7: Canal from P-Area to Ponds 4 and 5 – Including Pond 2
- EA8: Ponds 4 and 5 – Including canal from Ponds 4 and 5 to Pond C
- EA9: Pond C

R-Reactor initially discharged reactor effluent directly into Joyce Branch, while P-Reactor discharged reactor effluent directly into Steel Creek. In 1958, PAR Pond, along with a series of pre-cooler ponds and a connecting canal system, were constructed to address the cooling water requirements of both P- and R-Reactor. Effluent from R-Reactor was routed to the R-Area

Discharge Canal and pre-cooler Pond B where it discharged into the north arm of PAR Pond. This effluent pathway was used for R-Reactor discharge from 1961 until the reactor was shut down in 1964. Since the shutdown of R-Reactor, R-Area Discharge Canal and Pond B have remained essentially undisturbed.

PAR Pond also served as a heat exchange/cooling reservoir for P-Reactor until 1988. Heated water was released through a series of man-made canals and smaller impoundments into the pre-cooler Pond C and released into PAR Pond. Effluent discharges from P-Reactor ceased in 1987 with the shutdown of the reactor. As with the R-Area Discharge Canal, the associated canal system and pre-cooler ponds have remained essentially undisturbed. Releases from P-Reactor and R-Reactor operations included process leaks, reactor disassembly basin purges, and thermal discharges that contained primarily Cs-137.

The results of the investigation identified Cs-137 and, to a lesser degree Co-60, as refined constituents of concern (RCOCs) in sediment/soil media. In addition, Cs-137 and mercury (Hg) were identified as RCOCs in fish tissue; however, the presence of Hg is the result of atmospheric deposition and from the use of the elevated levels of Hg in Savannah River water as part of the river water distribution system, not from SRS operations. EA1, EA3 and EA5 had specific locations where Cs-137 levels were above the Principal Threat Source Material (PTSM) threshold of 144 picocuries per gram, however no PTSM RCOCs were formally identified for any EA within the LTR IOU.

### **Remedial Action**

Due to the complexity of the Upper subunit, multiple remedies were selected to address the nature and extent of contamination within the LTR IOU system. Land Use Controls (LUCs) with Monitored Natural Recovery (MNR) was the selected remedy for the entire Upper Subunit (EA1 through EA9). In addition, Excavation, Treatment, and Disposal of PTSM Sediment/Soil was selected to address the single location in EA1 in the R-Area Discharge Canal that exceeded the PTSM threshold, and the Maintain Water in Ponds remedy was selected to provide additional exposure protection for EA3 (Pond B), EA6 (PAR Pond) and EA9 (Pond C).

LUCs include engineering controls such as signs and gates at access points and administrative measures (i.e., deed restrictions and worker protection programs) to effectively reduce exposure of contaminated media to human receptors. MNR is a remedy that uses the ongoing, naturally-occurring process to contain, destroy, or reduce the bioavailability or toxicity of contaminants in sediment/soil. The MNR remedy component will assess the natural decay of Cs-137 in the Upper subunit over time. Cs-137 levels are expected to decay below the PTSM threshold in the Upper subunit in approximately 50 years, and the need to continue with the MNR component of the remedy will be reevaluated at that time.

For EA1, Excavation, Treatment, and Disposal of PTSM Sediment/Soil will be implemented to remove the single PTSM location in the R-Area Discharge Canal. The PTSM location is in relatively shallow water and is accessible for standard excavation practices. The excavated sediment/soil will be treated with a drying agent to reduce contaminant mobility during transportation and on-site disposal.

EA5 (Joyce Branch) contains two PTSM locations in shallow water. EA5 (Joyce Branch) is located interior to the site approximately 7.2 km (4.5 mi) from the SRS boundary, is remotely located from site operations, and is not accessible to the public (i.e., trespassers). Because PTSM is present in EA5 (Joyce Branch) in two locations, LUCs will be augmented in the form of additional signage at access roads and utility corridors in addition to gates across the access roads leading toward the two PTSM locations. Also, additional signs will be installed along the banks near the PTSM locations.

The Maintain Water in Ponds remedy selected for EA3 (Pond B) and EA6 (PAR Pond), will minimize access and limit exposure to submerged, contaminated sediment/soil within the ponds. A reverse riser structure associated with Pond C (EA9) allows water to flow from Pond C (EA9) into PAR Pond (EA6) using hydraulic pressure to stabilize water elevation between the two ponds. Therefore, the water level in Pond C will be maintained through implementation of this remedial action at PAR Pond (EA6). This remedy consists of maintaining dam structures for water retention, allows for natural fluctuation of water levels, and controls sediment movement downstream of the PAR Pond Dam. Annual inspections and periodic maintenance of the physical

attributes (i.e., dams, weirs, control gates, etc.) that make water retention viable are already in place per SRS procedures and the Federal Energy Regulatory Commission guidelines.
