EXECUTIVE SUMMARY

This Remedial Investigation with Baseline Risk Assessment has been prepared for the Automotive Repair Shop (716-A) Operable Unit. The Automotive Repair Shop (716-A) is a Comprehensive Environmental Response, Compensation, and Liability Act-only unit and is listed in Appendix C.4, Deactivation and Decommissioning Facilities (or Remnants) That May Warrant Response Action of the Savannah River Site Federal Facility Agreement.

This document presents a summary of the data collected, describes the nature and extent of contamination, and provides an assessment of the potential risk to human health and groundwater. The potential risk to ecological receptors is not assessed since the operable unit does not provide a viable habitat for ecological receptors.

The Automotive Repair Shop (716-A) is located in A Area at the Savannah River Site in Aiken, South Carolina (Figure ES-1). The single-story structure was constructed on a concrete slab and had an area of 3,903 m^2 (42,014 ft^2) under roof. The Automotive Repair Shop (716-A) consisted of service bays with offices, related storage areas, and mechanical and electrical rooms. This facility also contained vehicle lifting systems, a battery charging and storage room, and a brake repair area.

Under the Savannah River Site Deactivation and Decommissioning program, the Facility Decommissioning Evaluation for the Automotive Repair Shop (716-A) categorized the building as an "Other Industrial" Hazard Category facility and identified the Integrated Sampling Model as the appropriate decommissioning model for this potentially contaminated facility. A review of the Occurrence Reporting and Processing System/Site Item Reportability Issue Management database from 1993 to 2005 indicated no evidence of any spills to the environment. However, motor oil stains were found in the maintenance areas, 103 Lubrication Pit, side trench, hydraulic lifts, cylinders, and narrow trenches. Fluid/oil stains were removed during decommissioning and the trenches and sumps were sampled to verify contaminants were less than the applicable threshold levels.

As documented in the Decommissioning Project Final Report, chemical operations only took place in the Spray Paint Room. The human health risk assessment and contaminant migration analysis

conducted on the final verification survey data from the Spray Pain Room concluded that any residual contamination on the concrete slab were below threshold levels that could result in an exposure risk to human receptors or impact the groundwater. The Decommissioning Project Final Report for the Automative Repair Shop (716-A) concluded the building structure decommissioning activities were complete in 2005, including waste disposal in accordance with federal and state regulations. The building structure was demolished to the foundation. The clean concrete slab remains on its original footprint.

Comments received by the United States Environmental Protection Agency and the South Carolina Department of Environmental Services[1] on the Facility Decommissioning Evaluation and Decommissioning Project Final Report requested the Savannah River Site to conduct soil sampling underneath the Automotive Repair Shop (716-A) Operable Unit remnant slab at the 103 Lubrication Pit area and analyze for Target Analyte List/Target Compound List constituents to determine whether there has been a release to the environment. Because the soil beneath the Automotive Repair Shop (716-A) Operable Unit remnant slab was outside of the scope (i.e., physical boundary) of the facility decommissioning project, the Automotive Repair Shop (716-A) Operable Unit was transferred to Federal Facility Agreement Appendix C.4, *D&D Facilities (or Remnants) That May Warrant Response Action,* for further evaluation. Sampling beneath the concrete slab at the 103 Lubrication Pit was performed in accordance with the approved Remedial Investigation Work Plan. In addition, a comment received from the United States Environmental Protection Agency on the Facility Decommissioning Evaluation requested that all drain lines and/or sewer lines for the Automotive Repair Shop (716-A) Operable Unit be referred to, and further investigated by, the A-Area Operable Unit. Rather than deferring this scope to the A-Area Operable Unit, sampling beneath the drain lines and/or sewer lines was performed in accordance with the approved Remedial Investigation Work Plan for the Automotive Repair Shop (716-A) Operable Unit. Six soil boring locations were sampled as presented in Figure ES-2. Field work to support the Remedial Investigation Work Plan characterization was completed in December 2024.

The Remedial Investigation is based on soil and concrete media collected from the Automotive Repair Shop (716-A) Operable Unit. Groundwater is not part of the Operable Unit and will be

[1] South Carolina Department of Environmental Services (SCDES) was previously known as South Carolina Department of Health and Environmental Control prior to July 1, 2024.

addressed under the Resource Conservation and Recovery Act corrective action program defined in the Savannah River Site Resource Conservation and Recovery Act Permit Renewal for the M Area and Metallurgical Laboratory Hazardous Waste Management Facilities.

As agreed to by the Core Team during the June 2025 scoping meeting, the deactivation and decommissioning final verification survey data was sufficient to support the update of the risk evaluation, and no additional data was needed. The investigative data collected beneath the Automotive Repair Shop (716-A) for subsurface soils (all depths) per the Work Plan characterization supports the contaminant migration and principal threat source material analyses.

This Remedial Investigation and Baseline Risk Assessment determined that there is no risk to human health and the environment at the Automotive Repair Shop (716-A) Operable Unit. There are no human health, ecological, principal threat source material, or contaminant migration constituents of concern, and the Automotive Repair Shop (716-A) supports unrestricted land use. According to United States Environmental Protection Agency guidance, if there is no current or potential threat to human health and the environment and no action is warranted, the Comprehensive Environmental Response, Compensation, and Liability Act §121 requirements are not triggered. If the requirements are not triggered, there is no need to evaluate other cleanup alternatives or to evaluate the No Action alternative against the nine remedy selection criteria in a Feasibility Study. Therefore, a Feasibility Study for the Automotive Repair Shop (716-A) Operable unit is not needed.

Upon United States Environmental Protection Agency and South Carolina Department of Environmental Services approval of this Remedial Investigation and Baseline Risk Assessment, a No Action Proposed Plan and No Action Record of Decision will be prepared for the Automotive Repair Shop (716-A).

1.0 INTRODUCTION

This Remedial Investigation (RI) and Baseline Risk Assessment (BRA) has been prepared for the Automotive Repair Shop (716-A) Operable Unit (OU), located in A Area at the Savannah River Site (SRS) in Aiken, South Carolina (Figure 1-1).

The primary goal of the RI/BRA is to provide sufficient information to support a Proposed Plan (PP) and Record of Decision (ROD) for the selection of a final remedy for the Automative Repair Facility (716-A) OU, if warranted. The requirements of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) constitute the applicable regulatory framework for this document. The format and content of this document have been developed in accordance with decisions made by the Core Team (i.e., representatives from the U.S. Environmental Protection Agency [USEPA], South Carolina Department of Environmental Services [SCDES], and the U.S. Department of Energy [USDOE]).

The Automotive Repair Shop (716-A) OU RI/BRA describes the evaluations and decisions made during the scoping process, summarizes the characterization activities, and discusses the results of the contaminant migration (CM) and risk evaluations. Groundwater is not part of the OU and will be addressed under the Resource Conservation and Recovery Act (RCRA) corrective action program defined in the SRS RCRA Permit Renewal for the M Area and Metallurgical Laboratory Hazardous Waste Management Facilities.

1.1 Purpose and Organization of Report

The contents of this document generally follow the guidelines established in the *Environmental Compliance and Area Completion Projects Regulatory Document Handbook* (SRNS 2023).

Chapter 1, Introduction, broadly discusses the purpose and organization of the report, regulatory background, OU history, land use, and natural resource trustees. Chapter 2, Operable Unit Description, provides a review of the physical setting, geology and hydrogeology, and conceptual site model (CSM) descriptions. Chapter 3, Remedial Investigation, provides information on the characterization efforts, nature and extent of contamination, and results of the risk assessments and Principal Threat Source Material (PTSM) evaluations for each of the individual subunits. Chapter

4, Remedial Action Objectives and Preliminary Remediation Goals, discusses the remedial action objectives (RAOs), preliminary remediation goals (PRGs) (i.e., cleanup levels), and applicable or relevant and appropriate requirements (ARARs). Chapter 5, Summary/Conclusions, provides a summary of the complete report. Chapter 6, Implementation Schedule, provides a list of key deliverables and submittal dates. The list of document references is provided in Chapter 7.

Supporting information includes:

- Investigation Data/Data Summary Tables (Appendix A)
- Contaminant Fate and Transport Analysis (Appendix B)
- Human Health Risk Assessment (Appendix C)
- Principal Threat Source Material Evaluation (Appendix D)
- Natural Resource Injury Evaluation (NRIE) Checklist (Appendix E)
- Data Usability Report (Appendix F)
- Remedial Investigation Characterization Boring Logs (Appendix G)
- Remedial Investigation Characterization Data (Appendix H)

Appendices A through H are pertinent to supporting the conclusions presented in the RI/BRA.

1.2 Regulatory Background

On December 21, 1989, SRS was included on the National Priorities List. The inclusion created a need to integrate the established RCRA program with CERCLA requirements to provide for a focused environmental program. In accordance with Section 120 of CERCLA 42 United States Code Section 9620, the USDOE negotiated a Federal Facility Agreement (FFA) with USEPA and SCDES to coordinate remedial activities at SRS into one comprehensive program, which fulfills these dual regulatory requirements (FFA 1993). The FFA is a legally binding agreement between regulatory agencies and USDOE that establishes the responsibilities and schedules for the comprehensive remediation of SRS. The Automotive Repair Shop (716-A) OU is a CERCLA-only

unit and is listed in Appendix C.4, Deactivation and Decommissioning (D&D) Facilities (or Remnants) That May Warrant Response Action of the FFA (FFA 1993).

The Core Team agreed in the post-RI Work Plan characterization scoping meeting held on June 11, 2025, that all data needs had been met and the existing data for the Automotive Repair Shop (716-A) OU was sufficient for performing the risk evaluation, PTSM evaluation, and the CM analysis. Preliminary evaluation of the data presented at the June 11, 2025, scoping meeting supported no problems warranting action for the Automotive Repair Shop (716-A) OU. Because no problems warranting action were identified, the Core Team agreed that a Feasibility Study (FS) was not needed, and the project team should proceed with preparation of a RI/BRA report for submittal by September 30, 2025. The proposed strategy also supports proceeding from the approved RI/BRA report to a No Action PP and No Action Record of Decision.

The *Savannah River Site Federal Facility Agreement Community Involvement Plan* (WSRC 1996) facilitates public participation in the decision-making processes. Public participation requirements (Section 113 and 117 of CERCLA) include the establishment of an Administrative Record File (ARF) that documents the selection of cleanup alternatives and provides for review and comment by the public on those alternatives. This RI/BRA is part of the ARF and will be available to the public at USDOE's Public Reading Rooms at the University of South Carolina-Aiken in Aiken, South Carolina, and the Thomas Cooper Library in Columbia South Carolina. A notice will be published in local newspapers when information is being compiled regarding the investigation and cleanup of the Automotive Repair Shop (716-A) OU. Additional repositories may be added and/or locations changed to better meet the needs of the public.

1.3 Operable Unit History

A Area, which is part of the larger A/M Area in the northwestern portion of SRS (Figure 1-1), previously served as the main administrative area for the SRS and includes several RCRA/ CERCLA units. Maintenance facilities, such as the Automotive Repair Shop (716-A), were also housed within A Area (Figure 1-2).

The Automotive Repair Shop (716-A) was a single-story structure constructed on a concrete slab and had an area of 3,903 square meters (m^2) (42,014 square feet [ft^2]) under roof. The structure

footprint is approximately 55 meters (m) by 110 m (180 feet (ft) by 360 ft). The structure was erected and occupied in 1953. The facility was constructed of a structural steel frame with the exterior walls enclosed in asbestos cement board (transite). The roof consisted of a single ply conventional membrane that was loose laid and covered with stone ballast. The building was used as an automotive repair shop containing service bays with offices, related storage areas, mechanical and electrical rooms. This facility also contained many vehicle lifting systems, battery charging and storage room, and brake repair area prior to decommissioning (Figure 1-3).

On the southeast side of Building 716-A, was the location of an outside underground waste oil storage tank, which was removed per underground storage tank regulations in the early 1990's. The waste oil storage tank was replaced by a new above ground system. An ancillary structure identified as the firewater valve house was located on the west side of Automotive Repair Shop (716-A). The area around the Automotive Repair Shop (716-A) is surrounded by asphalt and/or gravel pavement used for gas stations and parking spaces.

1.3.1 Previous Actions

The Facility Decommissioning Evaluation (FDE) for the Automotive Repair Shop (716-A) categorized the building as an "Other Industrial" Hazard Category facility and identified the Integrated Sampling Model (ISM) as the appropriate decommissioning model for this potentially contaminated facility (WSRC 2005b). As documented in the Decommissioning Project Final Report (DPFR) for the Automotive Repair Shop (716-A), fluid/oil stains in the maintenance areas, lubrication pit, side trench, hydraulic lifts, cylinders, and narrow trenches were cleaned and removed using strong surfactants and hydro/power washed (WSRC 2005a). The trenches and sumps were sampled following removal of the fluid/oil stains, and the sampling results were verified to be less than the applicable Savannah River National Laboratory (SRNL) Derived Concentration Guideline Levels (DCGLs) and CM thresholds. The DPFR concluded the building structure decommissioning activities had been completed and there were no contaminants of concern in these areas. The building structure was demolished to the foundation and penetrations greater than 5 centimeters (cm) (2 inches [in]) in diameter were grouted, including all pits associated with the automotive hydraulic lift systems. The clean concrete slab remains on its original footprint.

Because chemical operations only took place in the Spray Paint Room, the post-decommissioning final verification survey was restricted to the Spray Paint Room remnant concrete slab (WSRC 2005c). Sixteen (16) sample locations composited in four sets of four samples were obtained for RCRA metals analysis (arsenic, barium, cadmium, chromium, lead, mercury [elemental], mercury [compounds], selenium, and silver) (Figure 1-5). Nine single samples were taken for volatile organic compounds (VOC) analysis (Figure 1-6). The DPFR documents the risk assessment that was conducted on the Spray Paint Room final verification sample results and a vadose zone contamination fate and transport model performed for the Automotive Repair Shop (716-A) OU concrete slab. As documented in the DPFR, there was no residual contamination at the Automotive Repair Shop (716-A) OU that exceeded the risk threshold and threshold levels that could impact the groundwater. The DPFR concluded that the remaining structure (i.e., remnant concrete slab) was free of hazards, both physical and chemical, and therefore warrants no further action (Figure 1-4).

Comments received by the USEPA and SCDES on the FDE and DPFR requested the SRS to conduct soil sampling for Target Analyte List/Target Compound List (TAL/TCL) constituents underneath the Automotive Repair Shop (716-A) OU remnant slab at the 103 Lubrication Pit area to determine whether there has been a release to the environment. Because the soil beneath the Automotive Repair Shop (716-A) Operable Unit remnant slab was outside of the scope (i.e., physical boundary) of the facility decommissioning project, the Automotive Repair Shop (716-A) Operable Unit was transferred to FFA Appendix C.4, *D&D Facilities (or Remnants) That May Warrant Response Action,* for further evaluation. In addition, a comment received from the USEPA on the FDE requested that all drain lines and/or sewer lines for the Automotive Repair Shop (716-A) OU be referred to, and further investigated by, the A-Area OU. Rather than deferring this scope to the A-Area OU, sampling beneath the remnant slab at the 103 Lubrication Pit and beneath the drain lines and/or sewer lines was performed in accordance with an approved RI Work Plan for the Automotive Repair Shop (716-A) Operable Unit (SRNS 2024). Field work to support the RI Work Plan characterization was completed in December 2024. The RI discussed in this RI/BRA report is based on soil and concrete samples collected from the Automotive Repair Shop (716-A) OU.

1.4 Land Use

The Automotive Repair Shop (716-A) OU is located in an area designated for industrial use as defined by the *Land Use Control Assurance Plan for the Savannah River Site* (WSRC 1999). No current or projected future development of the OU is planned. Groundwater is not part of the OU and will be addressed under the RCRA corrective action program defined in the SRS RCRA Permit Renewal for the M-Area and Metallurgical Laboratory Hazardous Waste Management Facilities.

1.5 Natural Resource Trustees

The potential for natural resource injuries is documented by completing the NRIE Checklist (Appendix E). The purpose of the NRIE Checklist is to identify potential natural resource injuries associated with CERCLA remedial activities. If potential injuries are identified, consideration is given as to whether trustee involvement is needed. The checklist is a starting point in potential injury identification and is not intended to be all-inclusive. The checklist has been designed as a series of questions to help identify the potential for natural resource injuries and what resources may be affected. It is based on the pre-assessment screen in Title 43 Code of Federal Regulations (CFR) 11.13.

The USDOE, as a trustee of its land, is responsible for identifying resources of concern. SRS integrates components of the Natural Resource Damage Assessment and RI/FS processes to assess potential threats to natural resources during the remedial process. The intent is to prevent potential injuries to natural resources that can occur as the result of remediation activities and to mitigate, to the extent practical, any injuries that have already occurred. The list of trustees for the SRS is included in Table 1-1.

Based on the NRIE Checklist (Appendix E), natural resources have not been adversely affected by hazardous substances from the Automotive Repair Shop (716-A) OU. No irreversible or irretrievable resource losses are known to exist.

2.0 OPERABLE UNIT DESCRIPTION

A discussion of the physical attributes of the Automotive Repair Shop (716-A) OU including habitats, ecological setting, surface features, meteorology, unit-specific geology, hydrology, surface water hydrology, and soils are described and depicted in the following sections.

2.1 Physical Setting

A Area, which is part of the larger A/M Area in the northwestern portion of SRS (Figure 1-1), previously served as the main administrative area for the SRS and includes several RCRA/ CERCLA units. Maintenance facilities, such as the Automotive Repair Shop (716-A), were also housed within A Area (Figure 1-2). The Automotive Repair Shop (716-A) contained service bays with offices, related storage areas, mechanical, electrical rooms, many vehicle lifting systems, battery charging and storage room, and a brake repair area. Only the concrete slab of the building remains after decommissioning (Figure 2-1). The location of previous processes at the Automotive Repair Shop (716-A) are shown in floorplans of the operating facility. Most notably, the 103 Lubrication Pit (Figure 2-2) and the Spray Paint Room (Figure 2-3).

2.1.1 Habitats and Ecological Setting

The Automotive Repair Shop (716-A) OU is located in an area designated for industrial use as defined by the SRS Land Use Control Assurance Plan (WSRC 1999). The Automotive Repair Shop (716-A) decommissioning activities had been completed with the building structure demolished to the foundation. The clean concrete slab remains on its original footprint and is the footprint associated with the Automotive Repair Shop (716-A). The concrete slab provides no appreciable ecological habitat.

2.1.2 Surface Features

The area around the Automotive Repair Shop (716-A) is surrounded by asphalt and/or gravel pavement used for gas stations and parking spaces (Figure 2-4). The topography is relatively flat, averaging about 111 m (365 ft) above mean sea level and sloping toward the south (Figure 2-5).

2.1.3 Meteorology

The climate of the central Savannah River area is humid and subtropical. It is characterized by hot summers and mild winters. Outbreaks of severe thunderstorms occur more frequently during the spring; rainfall is evenly distributed throughout the year (SRNL 2025). Except for the Savannah River valley, there are no topographic features that would significantly influence the general climate.

Meteorological monitoring has been conducted at the SRS since the 1950s. Monthly averages of temperature and precipitation based on a 30-year historical record of observations are presented in Table 2-1 and Table 2-2, respectively. During the summer months, temperatures at SRS typically average between 27 and 28 °C (80 and 82°F). On average, fall and spring temperatures range between 14 and 23 °C (57 and 74 °F). Winter temperatures average between 8.9 and 11 °C (48 and 52 °F). The 30-year average rainfall is 119 cm (47.0 in), with record low annual rainfall of 81.5 cm (32.1 in.) in 2010, and a record high annual rainfall of 163 cm (64 in.) in 2003. Average precipitation is relatively consistent throughout the year, with slightly higher rainfall occurring during the summer months when the humidity levels are higher.

2.2 Geology and Hydrology

This section describes the geology, hydrogeology, surface water hydrology, and soil types for the Automotive Repair Shop (716-A) OU.

2.2.1 Operable Unit-Specific Geology

SRS is situated on the Atlantic Coastal Plain, a wedge of unconsolidated and semi-consolidated sediments that thickens toward the southeast. Investigations into regional and SRS geology are summarized in the Hydrogeologic Framework of West-Central South Carolina and other reports (Aadland et al. 1995; Fallaw and Price 1995; Stieve and Stephenson 1995).

The geology in A Area is coastal plain sediments consisting of alternating beds of sands, silts, and clays. The vadose zone, a section of unsaturated and semi-saturated sediments from the ground surface down to the water table, is approximately (~) 42 m (140 ft) thick beneath the Automotive Repair Shop (716-A) OU and includes Eocene age sediments of the Clinchfield, Dry Branch, Tobacco Road, and Upland Unit lithostratigraphic formations. Surficial soils at the Automotive

Repair Shop (716-A) OU consist of fine-grained sediments (i.e., silty sandy clay) to a depth of ~9 m (30 ft), known as the Upland Unit. The Upland Unit has limited contaminant mobility to a significant degree by having a high porosity (i.e., void space between sediment grains) and low permeability (i.e., connectivity between sediment grains). The high porosity provides a space for temporary storage of the VOCs, while the low permeability restricts the VOCs from migrating downward. VOC migration through the Upland Unit is primarily achieved through diffusion. Below the Upland Unit, more permeable sediments extend downward to the water table at ~42 m (140 ft) below ground surface (bgs). The more permeable sediments consist of a series of silty sand beds separated by laterally discontinuous clay beds.

2.2.2 Operable Unit-Specific Hydrology

The water table in this area is ~42 m (140 ft) bgs. The regional direction of groundwater flow is south-southwest. The uppermost aquifer beneath the OU is the Steed Pond Aquifer unit, which is approximately 30 m (100 ft) thick. The Steed Pond Aquifer can be divided into the water table or M-Area Aquifer Zone, the Green Clay Confining Zone, and the Lost Lake Aquifer Zone hydrostratigraphic units (Figure 2-6).

2.2.3 Operable Unit Surface Water Hydrology

The five major streams that drain from the SRS to the Savannah River are the Upper Three Runs, Fourmile Branch, Pen Branch, Steel Creek, and Lower Three Runs. The Automotive Repair Shop (716-A) is in an area of relatively flat topographic relief gently sloping to the south toward the Upper Three Runs creek in the Upper Three Runs Watershed (Figure 2-7).

2.2.4 Operable Unit Soils

According to the United States Soil Conservation Service Soil Survey, A Area contains a large percentage of urban land that is not favorable to soil interpretation. The soil in A Area that can be qualified consist of udorthents (friable substratum) (USDA 1990). Udorthents soil type consists of mostly well drained soils that formed in heterogenous material, which are the spoil or refuse from excavations and major construction operations. The soil series cannot be identified due to use of heavy equipment extensively moving the soil material. Udorthents have a very low organic content and are strongly acid throughout. Udorthents range from sandy to clayey and are most associated with well drained upland soils. This soil type typically is low in nutrients and not suitable for crops.

2.3 Conceptual Site Model

The CSM is an objective framework for assessing data pertinent to the investigation. The preliminary CSM for the Automotive Repair Shop (716-A) OU (Figure 2-8) identifies and evaluates suspected sources of contamination, contaminant release mechanisms, potentially affected media (secondary sources of contamination), potential exposure pathways, and potential human health (HH) and ecological receptors that are evaluated in the risk assessment.

Exposure pathways describe the course a chemical or physical agent takes from the source to the exposed receptor. The following seven components constitute an exposure pathway:

1. *Primary Sources of Contamination* – the waste(s) initially disposed of or released within the subunit.
2. *Primary Sources Environmental Release Mechanisms* – how contaminants from the primary source enter the environment or impact secondary sources.
3. *Secondary Sources* – the environmental media contaminated by release of the primary source.
4. *Secondary Sources Environmental Release Mechanisms* – processes that currently, or may in the future, release contaminants for exposure to potential receptors.
5. *Exposure media* -identifies all media (soil, sediment, surface water, etc.) that could potentially be contaminated.
6. *Exposure routes* – method of entry into the receptor (e.g., external radiation, ingestion, dermal contact, inhalation, etc.)
7. *Receptors (Human and Ecological)* – potential future human receptors (e.g., hypothetical resident, industrial worker) as well as generic descriptions of potential ecological receptors (e.g., terrestrial, aquatic/semi-aquatic, etc.)

If any of these elements are missing, the pathway is incomplete and is not considered further in the quantitative risk assessment. A pathway is complete when all seven components are present to permit potential exposure of a receptor to a source of contamination. Exposure analysis is important in terms of identifying all potentially complete exposure routes, understanding the nature

and extent (as well as fate and transport) of contamination, and developing preliminary remedial alternatives. In a complete pathway, exposure occurs at exposure points that may represent only a small portion of the entire exposure route. If there is no exposure point, then there is no exposure, and the pathway is considered incomplete.

2.3.1 Primary Sources of Contamination

The Automotive Repair Shop (716-A) contained service bays with offices, related storage areas, and mechanical and electrical rooms. A review of the Occurrence Reporting and Processing System (ORPS)/Site Item Reportability Issue Management (SIRIM) database from 1993 to 2005 indicated no evidence of any spills to the environment. However, motor oil stains were found in the maintenance areas, lubrication pit (Room 103), side trench, hydraulic lifts, cylinders, and narrow trenches. Based on process knowledge, chemical operations only took place in the Spray Paint Room. Routine operations within the Automotive Repair Shop (716-A) potentially contaminated portions of the facility.

2.3.2 Primary Sources Environmental Release Mechanism

The environmental release mechanism evaluated as a primary source of contamination to the Automotive Repair Shop (716-A) OU subunit are spills/leaks. Environmental release mechanisms for primary sources of contamination have been inactive since 2005.

2.3.3 Secondary Sources of Contamination

The secondary sources for the Automotive Repair Shop (716-A) are the concrete pad, under pad or building soil, and deep soil (all depths). The post-decommissioning final verification survey was restricted to the concrete slab in the Spray Paint Room. As previously described in Section 2.0, the preliminary HH risk evaluation concluded that there are no problems warranting action and the exposure pathway is considered incomplete for the concrete pad portion of the facility. In addition, there are no complete exposure pathways for wildlife receptors.

2.3.4 Secondary Sources Environmental Release Mechanism

Potential contaminants in the soil beneath the 103 Lubrication Pit Area and the drain/sewer lines may leach to groundwater above groundwater protection standards and additional sampling and

evaluation is needed for these soils beneath the remnant concrete slab to determine whether there has been a release to the environment.

2.3.5 Exposure Media

The Automotive Repair Shop (716-A) exposure media include air vapor/particulate, concrete, subsurface soil, deep soil to a depth of 51 m (167 ft) bgs, and groundwater (i.e. CM analysis).

2.3.6 Exposure Routes

The exposure routes for the Automotive Repair Shop (716-A) include inhalation, ingestion, and dermal contact. External radiation was not considered since this building was considered non-radiological.

2.3.7 Potential Receptors (Human Health)

The industrial worker is the most appropriate receptor scenario for assessing potential risks associated with the concrete and soil of the Automotive Repair Shop (716-A). The hypothetical resident scenario is protective of the industrial worker since the resident is a more conservative scenario to assess potential risk to human receptors. A comparison of exposure assumptions to potential human exposure scenarios at SRS is provided below:

Potential Receptor	Years	Days/Year	Hours/Day	Exposure Hours
Hypothetical Resident	26	350	24	218,400
Industrial Worker	25	250	8	50,000

Source: SRNS 2023

Complete exposure pathways to potential human receptors for evaluation in this document are potentially industrial workers exposed to all soils should excavation activities occur. The PTSM evaluation addresses exposure to potentially highly toxic source material at all depths (Figure 2-8).

3.0 REMEDIAL INVESTIGATION

This section described the collection, assessment, and evaluation of the data that identify the problem(s) warranting action from the investigation.

3.1 Operable Unit Investigation Overview

As previously discussed, the DPFR for the Automotive Repair Shop (716-A) concluded that the remnant concrete slab was free of hazards, both physical and chemical, and therefore warrants no further action. Comments received by the USEPA and SCDES on the FDE and DPFR requested the SRS to conduct soil sampling for TAL/TCL constituents underneath the remnant slab at the 103 Lubrication Pit area to determine whether there has been a release to the environment. In addition, a comment received from the USEPA on the FDE requested that all drain lines and/or sewer lines for the Automotive Repair Shop (716-A) OU be investigated.

A comprehensive approach was implemented to address potential impact to human health and the environment at the Automotive Repair Shop (716-A) OU. Characterization through soil sampling was conducted as proposed in the approved RI Work Plan (SRNS 2024). Soil sampling was conducted beneath the Automotive Repair Shop (716-A) remnant concrete slab at the 103 Lubrication Pit and beneath the drain lines and/or sewer lines. Sample locations are presented in Figure 3-1.

3.2 Site Characterization and Data Usability

Characterization activities for soil media were conducted in 2024 for the Automotive Repair Shop (716-A) OU. No groundwater or surface water samples were collected.

Samples were collected from continuous soil cores from each boring, and lithologic descriptions were recorded. Rotosonic drilling and soil coring were utilized for sample collection at all six locations. The five locations (ARS-001-SB, ARS-002-SB, ARS-003-SB, ARS-004-SB, and ARS-006-SB) beneath the drain lines and/or sewer lines were continuously cored to a total depth of 17 m (57 ft) bgs, and samples were collected every 2 m (5 ft) through 15 m (50 ft). Additionally, the 103 Lubrication Pit location (ARS-005-SB) was continuously cored to a total depth of 51 m (167 ft) bgs, and samples were collected every 2 m (5 ft) through 15 m (50 ft) and every 3 m (10 ft)

thereafter to total depth. The total number of samples collected was 78. All samples were analyzed for all TAL/TCL constituents (excluding herbicides and pesticides). Appendix A provides the Investigation Data/Data Summary Tables.

The one deviation from the RI Work Plan was due to poor recovery of soil core in the first 6 m (21 ft) at location ARS-006-SB and no samples were collected in this interval. It is uncertain what caused the poor recovery in the first 6 m (21 ft) ft of core at ARS-006-SB. Its likely due to loosely compacted soil beneath the concrete slab being pushed away from the core barrel during drilling activities. Recovered material consisted of a water/soil slurry that contained a large amount of drilling fluids and was not able to be sampled as soil media. The loosely compacted soil could be explained by poor compaction during building construction activities. ARS-006-SB was located on the edge of the building footprint in close proximity to underground sewer lines. It is possible that water infiltrated through the transition between the concrete slab and the surrounding asphalt or that the sewer line had previously leaked. Either loosely compacted soil or excess water in the subsurface could have resulted in conditions causing poor recovery during drilling activities. The four samples that could not be collected from the first 6 m (21 ft) of core were distributed throughout the remaining core. Soil core and samples were successfully collected from 6 to 17 m (21 to 57 ft) at ARS-006-SB. Any contaminants present at this location would be expected to migrate through the loosely compacted soil into the deeper soil. The lack of contamination present in the soil samples collected from 6 to 17 m (21 to 57 ft) below grade at ARS-006-SB supports the conclusion that contamination is not present in this area. In addition soil core and soil samples were collected from approximately 0 to 6 m (0 to 21 ft) at ARS-005-SB (i.e., nearest soil boring located 12 m (40 ft) to the north) and the other four soil borings (i.e., ARS-001-SB through ARS-004-SB) with no results exceeding limits. SRS believes that the soil samples collected from 6 to 17 m (21 to 57 ft) at ARS-006-SB and the soil samples from the other five soil borings provide adequate coverage to eliminate any perceived data gap. Figure 3-2 presents a cross-section of the Automotive Repair Shop (716-A) OU soil beneath the remnant concrete slab. All of the soil results were utilized to assess the CM and PTSM constituents of concern (COCs). There were no Tier 1 CM COCs (Appendix B) or PTSM COCs (Appendix D) identified. Therefore, the contaminants at the Automotive Repair Shop (716-A) are not a potential source for groundwater contamination.

SRS data usability procedures incorporate the criteria found in the USEPA National Functional Guidelines to verify, validate, and qualify analytical data to assess its usability for risk and remedial management decisions. Adherence to this complex list of procedures and guidelines establishes: (a) if data meets the specific technical and quality control (QC) criteria established by the data quality objectives and laboratory quality assurance project plans, and (b) the usability of any data not meeting the specific technical and QC criteria. Adherence to the USEPA Functional Guideline requirements and the USDOE Audit Program for analytical laboratories allows the data to be qualified based upon a set of nationally established functional guideline qualifiers for uniformity.

The Data Usability Reports for the RI characterization samples are presented in Appendix F. The report concluded that data quality objectives were met, and that the data is considered useable for the purposes of remedial decision-making in the RI/BRA.

3.3 Unit-Specific Constituent Screening

A data evaluation to determine the nature and extent of contamination at the Automotive Repair Shop (716-A) OU was conducted by comparing the 2024 characterization soil data for all depth intervals to SRS background data represented in Appendix B-2 Upland Soils (All Depth Intervals) of the approved *Background Soils Statistical Summary Report for the Savannah River Site* (WSRC 2006). The maximum concentration of a constituent that is greater than two-times (2X) the SRS background mean concentration is more likely to be present from unit-related activities and is identified as a unit-specific constituent (USC). Constituents for which no background concentrations are available are also identified as USCs if detected at one of more locations and depth intervals. Constituents identified as USCs are evaluated in the contaminant fate and transport analysis (Appendix B) and the PTSM evaluation (Appendix D).

The USCs identified for the Automotive Repair Shop (716-A) OU are provided in Appendix A. The nature and extent of USCs is discussed in more detail in Section 3.8.

3.4 Contaminant Fate and Transport Analysis

Simulations of contaminant transport through the vadose zone were completed for the Automotive Repair Shop (716-A) OU using Vadose Zone Contaminant Migration Model Multi-Layered

software V.4.0 (VZCOMML©), a multi-layer vadose zone CM modeling program developed by SRS. VZCOMML© is intended to provide a conservative initial screening.

For the VZCOMML© Tier 1 screening, the Automotive Repair Shop (716-A) OU was modeled under the most conservative assumptions including maximum constituent concentrations at the maximum sample depth (i.e., shortest travel time distance in the vadose zone to water table). During Tier 1 screening, constituents predicted to have the potential to impact groundwater at concentrations exceeding action levels are retained as Tier I CM constituents of potential concern (COPCs). The Tier II Simulation 1 uses the same conservative assumptions (maximum constituent concentrations and deepest source zone) to predict constituents that will impact groundwater at concentrations exceeding action levels within the evaluation time of 1,000 years. Constituents predicted to exceed action levels in the Tier II Simulation 1 are retained as Tier II CM COPCs. Where justified, conservatism in the model is removed for Tier II CM COPCs in a Tier II Simulation 2. Constituents retained following Tier II simulations are retained as CM COCs.

CM COCs are evaluated further based on site-specific data and professional judgement to further refine the list of COCs in an uncertainty evaluation (i.e., weight-of-evidence discussion) (Appendix B). Any constituents that are not dismissed in the uncertainty evaluation are retained as CM Refined COCs (RCOCs) and considered problems warranting action.

Results from the Tier I screening identified no constituents as COPCs; therefore, no Tier II screening was conducted. The detailed CM analysis and results for the Automotive Repair Shop (716-A) are presented in Appendix B.

3.5 Human Health Risk Assessment Methodology

The risk evaluation previously approved in the DPFR was based on the post-decommissioning final verification survey results of the Spray Paint Room remnant concrete slab. As discussed in more detail in Appendix C, the risk evaluation in the DPFR followed protocols that were developed by the Savannah River National Lab (SRNL) (i.e., comparison to SRNL Derived Concentration Guideline Levels [DCGLs]) in the 2004-2005 timeframe. The total cumulative risk (TCR) risk to an industrial worker exposed to the remnant concrete slab was estimated to be 4.36E-07. The non-cancer hazard index (HI) for the concrete slab was estimated to be 0.049.

The risk evaluation process presented in historical D&D documentation do not align with the current methodology for evaluating human health risk in the Environmental Compliance and Area Completion Projects (EC&ACP) Regulatory Document Handbook (SRNS 2023). To verify that the risk assessment conclusions of the DPFR for the Automotive Repair Shop (716-A) risk evaluation are still valid, the Core Team agreed to reevaluate the results of the D&D risk assessment using current EC&ACP risk evaluation protocols and threshold values (SRNS 2023).

Risk-based threshold levels used in the reevaluation were obtained from the USEPA Regional Screening Levels (RSLs) website (USEPA 2024). Per SRS protocols, RSLs for soil media are multiplied by ten (10x) to obtain thresholds for concrete media (SRNS 2023). This conversion acknowledges that the exposure assumptions for competent, hardened concrete are different from (i.e., less than) the exposure assumptions for more friable soil media.

Risk and hazard estimate calculations for the reevaluation of the Spray Paint Room remnant concrete slab were based on the maximum detected concentration of each analyte to provide the most conservative risk/hazard result compared to the RSL values. HH COCs for the residential and industrial worker risk scenarios are identified when both the HI and individual constituent hazard quotients exceed 1 for noncarcinogens and constituent-specific risk exceeds 1E-06 for carcinogens.

Any individual constituent that is identified as a COC is further evaluated in a refinement step. The refinement step is an uncertainty evaluation that includes an interpretive discussion of the applicable uncertainty factors (line of evidence) and a recommendation whether the constituent should or should not be identified as a RCOC. The results of this process determine if remedial actions need to be evaluated to protect HH receptors.

3.6 Ecological Risk Assessment Methodology

A quantitative ecological risk assessment for the Automotive Repair Shop (716-A) is not warranted. The remnant concrete slab does not provide any appreciable habitat, and a survey of the surrounding area indicates the physical setting does not provide adequate habitat for population level impacts to wildlife receptors since it is very small in size and located in an industrial setting. There are no problems warranting action from an ecological risk perspective.

3.7 Principle Threat Source Material Evaluation Methodology

The PTSM evaluation for the Automotive Repair Shop (716-A) OU is presented in Appendix D. The concept of principal threat waste and low-level threat waste, as developed by the USEPA in the National Oil Hazardous Substances Contingency Plan (NCP) (40 CFR 300.430[a][1][iii]), is to be applied on a site-specific basis when characterizing source material. Source materials include or contain hazardous substances, pollutants, or contaminants that act as a reservoir for migration to surface water, or air, or act as a source for direct exposure. The determination of whether the source materials present at a waste unit would be classified as PTSM is based principally on the USEPA guidance (USEPA 1991).

In determining whether the source should be preliminarily considered PTSM, the evaluation considers the cumulative effects of both the potential risk from carcinogenic constituents and the adverse health effects from noncarcinogens to human receptors. The toxicity assessment of the source material is based on the potential exposure of an industrial worker, which is the most appropriate receptor scenario at the Automotive Repair Shop (716-A) OU.

The source material (i.e., in soil) from all depth intervals is preliminarily considered to be PTSM if the cumulative risk exceeds one of the following toxicity threshold criteria:

- Carcinogens: greater than 1E-03 industrial worker risk
- Noncarcinogens: industrial worker HI greater than 10

If the threshold criteria for PTSM is not exceeded based on a maximum concentration, then PTSM is not present, and it is not necessary to carry the assessment into an uncertainty evaluation. An uncertainty evaluation is performed on potential PTSM constituents using similar criteria as that used for the identification of HH RCOCs. This evaluation includes, but is not limited to, assessing the potential for natural degradation, or lack thereof, that would reduce concentrations over time, as applicable.

3.8 Operable Unit

3.8.1 Automotive Repair Shop (716-A) Description

The Automotive Repair Shop (716-A) was decommissioned using the D&D ISM. Fluid/oil stains were removed during decommissioning, and the trenches and sumps were sampled to verify contaminants were less than DCGLs and CM threshold levels. As documented in the DPFR, the post-decommissioning final verification survey of the Spray Paint Room remnant concrete slab concluded there was no residual contamination that exceeded the risk threshold or threshold levels that could impact groundwater. Therefore, the DPFR for the Automotive Repair Shop (716-A) concluded the building structure decommissioning activities had been completed, including waste disposal in accordance with federal and state regulations. The building structure was demolished to the foundation. The DPFR documented that the remnant concrete slab was free of hazards and warranted no further action. The clean concrete slab remains on its original 55 m by 110 m (180 ft by 360 ft) footprint.

Comments received by the USEPA and SCDES on the FDE and DPFR requested the SRS to conduct soil sampling for TAL/TCL constituents underneath the remnant slab at the 103 Lubrication Pit area and beneath drain lines and/or sewer lines to determine whether there has been a release to the environment.

3.8.2 Automotive Repair Shop (716-A) Characterization and Data Summary

In accordance with the approved RI Work Plan (SRNS 2024), subsurface soils at six locations were collected in December 2024 (Figure 3-1). Five soil borings were continuously cored to a total depth of 17 m (57 ft) bgs, and one location was cored to a depth of 51 m (167 ft) bgs. A cross-section with sample depths is provided in Figure 3-2. From the six soil borings, a total of 70 regular samples, four split samples, and four field duplicate samples were collected. Samples were collected from continuous soil cores from each boring, and lithologic descriptions were recorded. The one exception was at location ARS-006-SB, where no samples were collected from the first 6 m (21 ft) of the boring due to poor soil recovery. Rotosonic sample collection was used for all six locations. The five locations (ARS-001-SB, ARS-002-SB, ARS-003-SB, ARS-004-SB, and ARS-006-SB) beneath the drain lines and/or sewer lines were continuously cored to a total depth of 17 m (57 ft) bgs, and samples were collected every 2 m (5 ft) through 17 m (57 ft).

Additionally, the 103 Lubrication Pit location (ARS-005-SB) was continuously cored to a total depth of 51 m (167 ft) bgs, and samples were collected every 2 m (5 ft) through 15 m (50 ft) and every 3 m (10 ft) thereafter to total depth. The total number of samples collected was 78.

3.8.3 Automotive Repair Shop (716-A) Nature and Extent of Contamination

Constituents identified as USCs for the Automotive Repair Shop (716-A) OU are shown in Appendix A. There were 33 constituents that were detected from all the soil results collected at the six soil borings. Maximum soil concentrations from those 33 detected constituents were compared against two-times (2X) the SRS mean background concentrations (WSRC 2006), if applicable, to determine if the constituent was a USC. Constituents above detection limits and without an SRS mean background were considered USCs. Thirty-one constituents were identified as USCs (i.e., acetone; aluminum; arsenic; barium; benzo(b)fluoranthene; beryllium; bis(2-ethylhexyl)phthalate (DEHP); butyl benzyl phthalate; calcium; chromium; cobalt; copper; dichloromethane (methylene chloride); diethyl phthalate; di-n-butyl phthalate; iron; lead; magnesium; manganese; mercury; nickel; n-dioctyl phthalate; potassium; selenium; silver; sodium; thallium; toluene; trichloroethylene; vanadium; and zinc). The primary contaminants at the Automotive Repair Shop (716-A) OU are inorganics (metals) and VOCs. Soil sampling at the Automotive Repair Shop (716-A) OU is sufficient to determine the nature and extent of contamination and the presence or absence of problems warranting response action.

3.8.4 Automotive Repair Shop (716-A) Contamination Fate and Transport Evaluation Results

A contaminant migration analysis using VZCOMML® was performed for the subsurface soil data collected at the six locations in accordance with the approved RI Work Plan (SRNS 2024). The complete analysis is detailed in Appendix B. None of the 31 USCs failed the Tier I screen. Therefore, no Tier II simulations were conducted.

Results of the CM analysis confirm that the contaminants at the Automotive Repair Shop (716-A) OU are not a potential source for groundwater contamination.

3.8.5 Automotive Repair Shop (716-A) Human Health Risk Assessment Results

The risk information presented in the DPFR is based on the final verification survey data from concrete samples collected from the Spray Paint Room and evaluated using protocols that were

developed by the SRNL (i.e., comparison to SRNL DCGLs) in the 2004-2005 timeframe. The DPFR concluded that there were no problems warranting action for human receptors at the Automotive Repair Shop (716-A) OU remnant concrete slab. To verify that the risk assessment conclusions of the DPFR for the Automotive Repair Shop (716-A) risk evaluation were still valid, the Core Team agreed to reevaluate the results of the DPFR risk assessment using current EC&ACP risk evaluation protocols and threshold values (SRNS 2023).

The reevaluation of the original data set from concrete samples collected in the Spray Paint Room using current protocols is provided in Appendix C. The updated residential scenario had a noncarcinogenic HI = 0.9 and cancer TCR = 4E-07. The updated industrial worker scenario had an HI = 0.05 and cancer TCR = 9E-08. Because no HH COCs were identified, no uncertainty evaluation was needed. The updated risk evaluation confirmed the conclusions of the DPFR that there are no problems warranting action for human receptors at the Automotive Repair Shop (716-A).

3.8.6 Automotive Repair Shop (716-A) Ecological Risk Assessment Results

A quantitative ecological risk assessment for the Automotive Repair Shop (716-A) OU is not warranted. The remnant concrete slab does not provide any appreciable habitat, and a survey of the surrounding area indicates the physical setting does not provide adequate habitat for population level impacts to wildlife receptors since it is very small in size and located in an industrial setting.

There are no problems warranting action from an ecological risk perspective.

3.8.7 Automotive Repair Shop (716-A) Principal Threat Source Material Evaluation Results

A PTSM evaluation was performed for the subsurface soil data collected at six locations in accordance with the approved RI Work Plan (SRNS 2024). Source material is considered PTSM if the cumulative risk is greater than 1E-03 or the HI is greater than 10 for the industrial worker. Results of the PTSM evaluation presented in Appendix D show that the HI is 6.57E-01 and the cumulative risk is 1.09E-05 (Appendix D). No PTSM RCOCs are identified for the Automotive Repair Shop (716-A) OU soil media.

3.8.8 Automotive Repair Shop (716-A) Summary of Problems Warranting Action

No CM, HH, ecological, or PTSM RCOCs were identified for the Automotive Repair Shop (716-A) OU. There are no problems warranting action for the Automotive Repair Shop (716-A) OU.

3.9 Summary of Refined Constituents of Concern and Refined Conceptual Site Model

Figure 3-3 presents the refined CSM for the Automotive Repair Shop (716-A) OU. The CSM presents that no further evaluation of concrete and subsurface soils is required based on the results of the HH risk assessment, CM, and PTSM evaluations. A quantitative ecological risk assessment for the Automotive Repair Shop (716-A) OU is not warranted.

3.10 Applicable or Relevant and Appropriate Requirements Evaluation

There is no current or potential threat to public health, welfare, or the environment from the Automotive Repair Shop (716-A) OU. There are no potential ARARs for this OU.

3.11 Nature Resource Injury Evaluation

The NRIE Checklist and supporting descriptions are provided in Appendix E. Based on the NRIE Checklist, natural resources in the locale have not been impacted by hazardous substances from the Automotive Repair Shop (716-A) OU. No irreversible resource losses are known to exist.

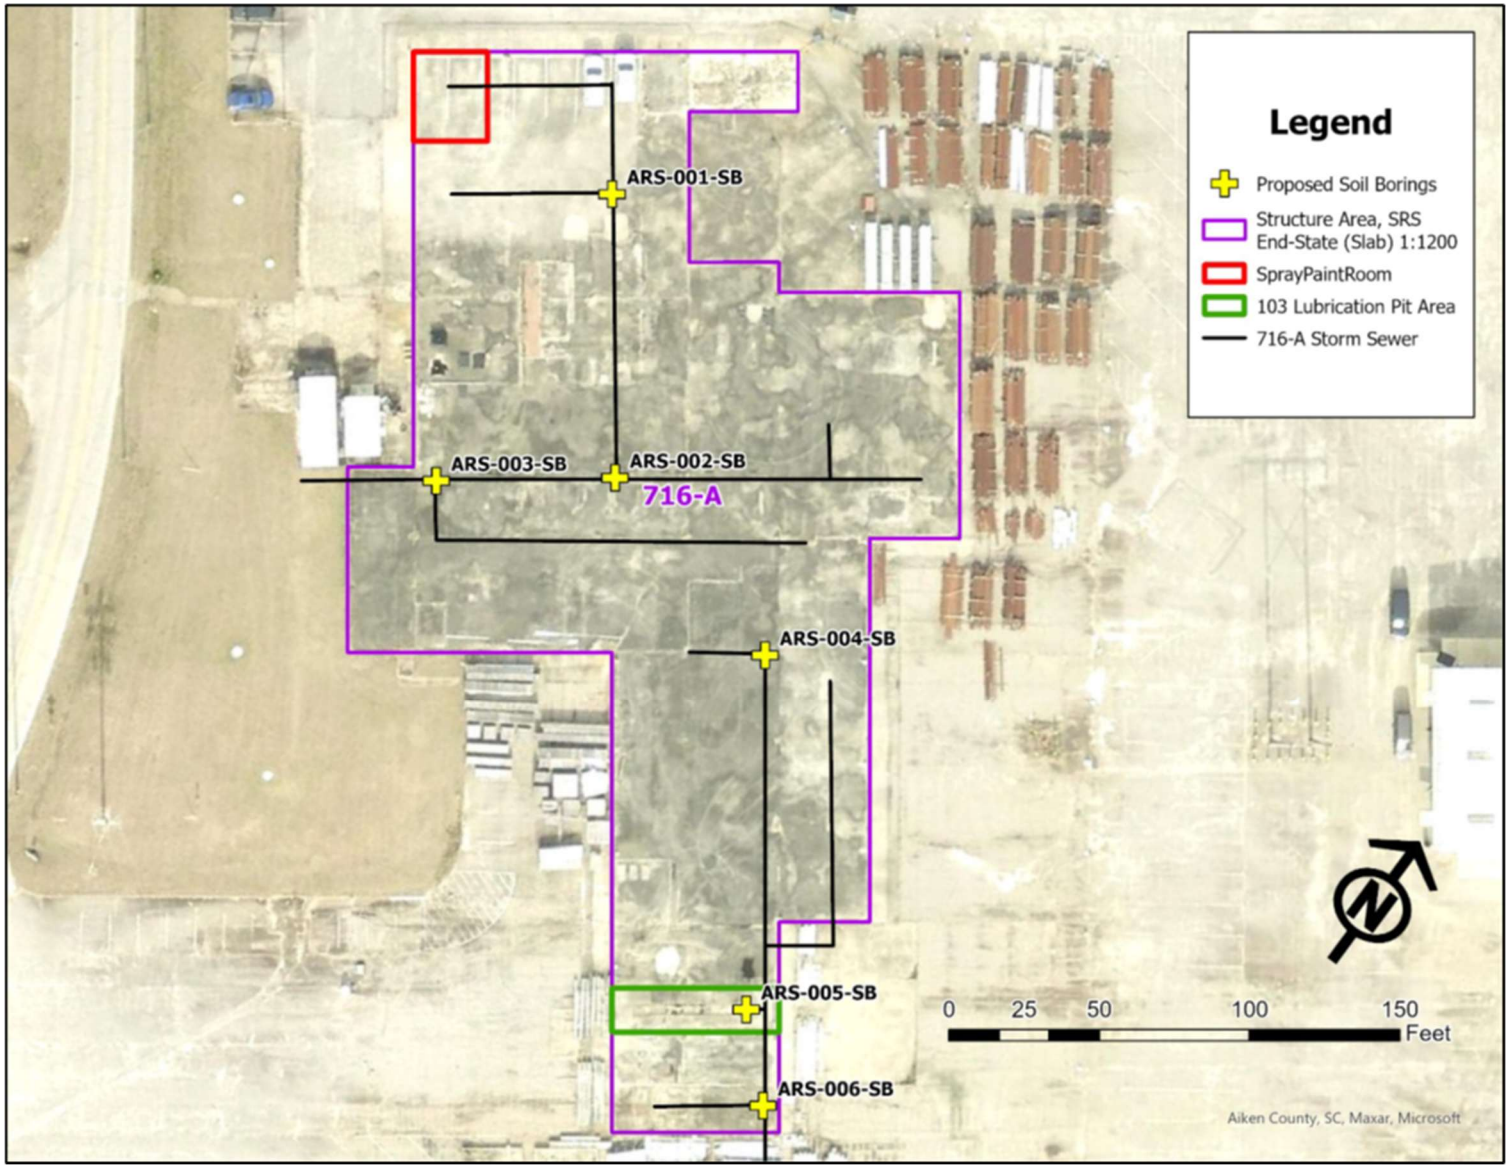

Figure 3-1. Soil Sampling Locations at the Automotive Repair Shop (716-A) Operable Unit

4.0 REMEDIAL ACTION OBJECTIVES AND PRELIMINARY REMEDIAL GOALS

4.1 Remedial Action Objectives

RAOs are site-specific or media-specific objectives for protecting human health and the environment. RAOs usually specify potential receptors and exposure pathways and are identified during scoping once the conceptual site model is understood. RAOs describe what the cleanup will accomplish and are used as a framework for developing remedial alternatives. The RAOs are based on the nature and extent of contamination, threated resources, and the potential for human and environmental exposure.

No CM, HH, ecological, or PTSM RCOCs were identified for the Automotive Repair Shop (716-A) OU. There are no problems warranting action for the Automotive Repair Shop (716-A) OU. Therefore, the development of RAOs for the Automotive Repair Shop (716-A) OU is not warranted.

4.2 Preliminary Remedial Goals Development

PRGs represent the preliminary media-specific goals and serve as a standard by which to measure whether a selected remedial action has met its RAO. PRGs can be qualitative statements or numerical values often expressed as concentrations in soil and groundwater or actions (e.g., installation of engineered barriers, placement of caps and covers, etc.) that achieve the RAO. PRGs become finalized as remedial goals (RGs) after public comment and approval of the CERCLA PP and are documented in the Record of Decision (ROD) for the OU.

As discussed below, there are no problems warranting action for the Automotive Repair Shop (716-A) OU and no RAOs identified. Therefore, the development of PRGs is not required.

4.2.1 Contaminant Migration Preliminary Remedial Goals

The contaminant migration analysis is presented in Appendix B of this document. No contaminant migration RCOCs were identified for any of the Automotive Repair Shop (716-A) OU; therefore, CM PRGs are not developed.

4.2.2 Human Health Preliminary Remedial Goals

The HH risk assessment is presented in Appendix C of this document. HH RCOCs were not identified for Automotive Repair Shop (716-A) OU; therefore, HH PRGs were not developed.

4.2.3 Ecological Preliminary Remedial Goals

A quantitative ecological risk assessment for the Automotive Repair Shop (716-A) OU is not warranted since the concrete slab does not provide any appreciable habitat and a survey of the surrounding area indicates the physical setting does not provide adequate habitat for community-level impacts to wildlife receptors since the OU is small in size and located within an industrial setting. No ecological RCOCs were identified for the Automotive Repair Shop (716-A); therefore, no ecological PRGs were developed.

4.2.4 Principal Threat Source Material

The PTSM evaluation is presented in Appendix D of this document. No PTSM RCOCs were identified for the Automotive Repair Shop (716-A) OU; therefore, PTSM PRGs are not developed.

4.2.5 Applicable or Relevant and Appropriate Requirements Preliminary Remedial Goals

No action-specific, location-specific, and chemical-specific requirements ARARs were identified for the Automotive Repair Shop (716-A) OU; therefore, no ARAR PRGs are presented.

5.0 SUMMARY / CONCLUSION

The Automotive Repair Shop (716-A) OU was evaluated per the approved EC&ACP Regulatory Handbook protocols (SRNS 2023). Based on the characterization results, human health risk assessment, PTSM evaluation, and CM analysis, the Automotive Repair Shop (716-A) OU poses no risk to human health and the environment. No constituents were identified as HH RCOCs, CM RCOCs, or PTSM RCOCs. A quantitative ecological risk assessment for the Automotive Repair Shop (716-A) OU was not warranted since the concrete slab does not provide any appreciable habitat and a survey of the surrounding area indicates the physical setting does not provide adequate habitat for community-level impacts to wildlife receptors.

This RI/BRA determined that there was no risk to human health and the environment, and the Automotive Repair Shop (716-A) supports unrestricted land use. According to USEPA guidance, if there is no current or potential threat to human health and the environment and no action is warranted. The CERCLA §121 requirements are not triggered; therefore, there is no need to evaluate other cleanup alternatives or to evaluate the No Action alternative against the nine remedy selection criteria in a FS. Since no RCOCs were identified for the Automotive Repair Shop (716-A) OU, no RAOs were developed, and no cleanup levels were established. Therefore, a FS for the Automotive Repair Shop (716-A) OU is not warranted.

Upon USEPA and SCDES approval of this RI/BRA, a No Action PP and No Action ROD will be prepared for the Automotive Repair Shop (716-A) OU.

6.0 IMPLEMENTATION SCHEDULE

A summary of the key deliverables and submittal dates for the Automotive Repair Shop (716-A) is shown below. These dates are listed in the USEPA and SCDES approved OU implementation schedule and are included in the FFA (FFA 1993).

Deliverable	Submittal Date
Submit Rev. 0, PP	July 14, 2026
Submit Rev. 0, ROD	January 10, 2027
Issuance of the ROD	September 21, 2027

This page is intentionally left blank.

APPENDIX A. INVESTIGATION DATA/DATA SUMMARY TABLES

A.1 DATA SUMMARY TABLES

This appendix provides the data used in the contaminant migration analysis, human health risk assessment, and principal threat source material evaluation. Data summary and unit specific constituent screening tables are provided for the Automotive Repair Shop (716-A) OU. Investigation data is provided under separate cover on the electronic version of this document.

The data generated by the ProUCL software (v 5.2) for each detected analyte is presented in this appendix (Table A.2-1). Outputs from the software are used to summarize the data from the Automotive Repair Shop (716-A) OU to develop the data summary tables per Protocol DP-1 – *Unit-Source Data Processing* in the EC&ACP Regulatory Document Handbook. Distribution codes, Upper Confidence Limit (UCL) method, and 95% UCL are reported for all depths as determined from the outputs. The output from the ProUCL data processing is not included due to the robust nature of the output files that are run for each individual analyte per depth interval. These results were verified by peer checking and can be reverified, if needed, by processing the soil data provided in electronic format through the ProUCL software that is available online (https://www.epa.gov/land-research/proucl-version-5100-documentation-downloads).

A.2 AUTOMOTIVE REPAIR SHOP (716-A) OU SOIL DATA

In accordance with the *Remedial Investigation Work Plan for the Automotive Repair Shop (716-A) Operable Unit* (SRNS-RP-2023-01234, Revision 1, May 2024), six soil borings were collected to investigate soils below the Automotive Repair Shop (716-A) storm sewer lines and the 103 Lubrication Pit. Five soil borings (ARS-001-SB, ARS-002-SB, ARS-003-SB, ARS-004-SB, and ARS-006-SB) were continuously cored to a total depth of 17 m (57 ft) bgs. Location ARS-005-SB, was continuously cored to a total depth of 51 m (167 ft) bgs. Table A.2-1 presents a summary of the analytical data for the Automotive Repair Shop (716-A) OU soil borings for all depths. The USC screening table for the subunit soil data at all depths (Table A.2-2). Per Protocol USC-1 *Unit-Source Data Processing* in the EC&ACP Regulatory Document Handbook, those constituents whose unit-source maximum concentrations are greater than twice the average background concentrations are labeled USCs. There were 33 constituents that had concentrations above detectable limits while 31 of those 33 were identified as USCs.

B.1 INTRODUCTION

The purpose of this appendix is to determine the fate and transport of contaminants associated with the Automotive Repair Shop (716-A) Operable Unit (OU). This determination will support Core Team (i.e., representatives from the United States Department of Energy [USDOE], United States Environmental Protection Agency [USEPA], and South Carolina Department of Environmental Services [SCDES][a]) remedial decisions for the Automotive Repair Shop (716-A) OU. The Automotive Repair Shop (716-A) OU is listed in Appendix C.4, D&D Facilities (or remnants) That May Warrant Response Action of the Federal Facility Agreement (FFA) (FFA 1993).

The organic and inorganic unit-specific constituents (USC) listed in Appendix A were evaluated in the CM analysis. The Automotive Repair Shop (716-A) was a nonradiological building; therefore, radiological constituents were not considered. The CM analysis was performed using the spreadsheet model VZCOMML© (V.4.0) (WSRC 2007) which accounts for decay processes, infiltration rate, soil properties, vadose zone thickness, and chemical behavior. Soil screening limits (SSLs) were calculated by the model, and an exceedance of a SSL by a vadose zone constituent indicates that the resultant maximum groundwater concentration has the potential to exceed the regulatory limits (e.g., maximum contaminant levels [MCLs]) within the compliance period of 1,000 years (yr). Interpretation of the results and discussion of exceeding constituents are provided in the following sections of this appendix, as appropriate.

B.2 CONTAMINANT MIGRATION MODEL

B.2.1 Background

The Automotive Repair Shop (716-A) OU was used as an automotive repair facility containing service bays with offices, related storage areas, mechanical, and electrical rooms. The building was erected on top of a concrete slab and occupied in 1953. Fluid/oil stains were found in the maintenance areas, lubrication pit (Room 103), side trench, hydraulic lifts, cylinders, and narrow

a South Carolina Department of Environmental Services (SCDES) was known as South Carolina Department of Health and Environmental Control (SCDHEC) prior to July 1, 2024.

trenches. Based on process knowledge, chemical operations only took place in the Spray Paint Room.

The Automotive Repair Shop (716-A) OU was decommissioned using the Deactivation and Decommissioning Integrated Sampling Model (ISM) in the 2004-2005 timeframe. Fluid/oil stains that were part of routine operation of Automotive Repair Shop (716-A) were removed, and the building structure was demolished to the remnant concrete slab foundation. The Decommissioning Project Final Report (DPFR) (WSRC 2005a) concluded the building structure decommissioning activities have been completed, including waste disposal in accordance with federal and state regulations. The building structure was demolished to the foundation, and the clean remnant concrete slab remains on its original footprint.

A vadose zone contamination fate and transport model (Vadose Zone Contaminant Migration Model – Multi-Layered [VZCOMML] [WSRC 2007]) was performed for the Automotive Repair Shop (716-A) OU concrete slab and documented *Decommissioning Project Final Report 716-A, Automotive Repair Shop* (WSRC 2005a). The DPFR concluded that residual contamination on the Automotive Repair Shop (716-A) OU concrete slab were below threshold levels that could impact the groundwater. The VZCOMML© software and the underlying physical and mathematical basis are documented in a technical report.

Comments received by the USEPA and the SCDES on the Automotive Repair Shop (716-A) OU Facility Decommissioning Evaluation (FDE) (WSRC 2005b)and DPFR (WSRC 2005a) requested SRS to conduct soils samples beneath the Automotive Repair Shop (716-A) OU remnant slab at the 103 Lubrication Pit area and beneath drain lines and/or storm sewer lines to confirm that there has not been a release to the environment. In accordance with the approved Remedial Investigation (RI) Work Plan (SRNS 2024), subsurface soils at six locations were collected in December 2024 to support the CM analysis and the principle threat source material (PTSM) evaluation.at five additional locations The PTSM evaluation is presented in Appendix D. Five soil borings were continuously cored to a total depth of 57 feet below ground surface, and one location was cored to a depth of 167 feet bgs. A cross-section with sample depths is provided in Figure B-1. From the six soil borings, a total of 70 regular (REG) samples, four split samples, and four field duplicate samples were collected.

All samples were analyzed for Target Analyte List (TAL) and Target Compound List (TCL) constituents (excluding herbicides and pesticides). From the 70 REG samples, 33 constituents were detected in at least one sample. Appendix A presents a summary of the detected results from the Work Plan characterization, and the 31 constituents that exceeded two times (2X) SRS background concentrations (WSRC 2006) and identified as USCs.

The 31 USCs identified from the collected soil samples were included in the CM analysis evaluation using the calculated 95% upper confidence levels (UCL) in accordance with data processing protocols in the *Environmental Compliance and Area Completion Regulatory Document Handbook* (SRNS 2023). The maximum detected concentrations were used when the 95% UCL could not be estimated for certain constituents. The CM analysis screening was completed using VZCOMML© (Table B-1).

B.2.2 Screening Methods

This section describes screening methods used for identifying CM constituents of potential concern (COPCs) and CM constituents of concern (COCs) for Savannah River Site (SRS) OUs. The identification of CM COPCs and CM COCs is facilitated by the VZCOMML© V.4.0 program (WSRC 2007).

The CM analysis follows the protocols and guidelines established in the *Environmental Compliance and Area Completion Projects Regulatory Document Handbook* (SRNS 2023). For the Tier I screen, the most conservative assumptions for source thickness, depth to groundwater, and subsurface properties are used. USEPA default SSLs are calculated for the Tier I screen, which are then compared to the maximum concentrations of all detected constituents. Constituents with concentrations that are greater than the calculated Tier I SSLs have the potential to impact groundwater at levels exceeding action levels and therefore are retained as Tier I CM COPCs. A less conservative set of assumptions are used for the Tier II analyses to assess impact to groundwater at concentrations exceeding action levels within the evaluation time (T_e) of 1,000 yrs. The Tier II screen accounts for physical and chemical complexities associated with vadose zone transport and more accurately predicts risks of exposure via the CM pathway. Constituents with maximum source zone concentrations that exceed the Tier II SSLs within the T_e are retained as Tier II CM COCs.

Both the Tier I and Tier II screens include infinite source mass and limited source mass calculations. In reality, the consideration of an infinite source mass is not reasonable, so the mass-limited calculations (default mass-limited SSLs and SRS site-specific mass-limited SSLs [MLSSL]) consider the entire release of the source mass within a 70-yr exposure period. This prevents a source mass balance error (i.e., releasing more contaminant mass than is actually contained in the source) in the calculation, which is likely with the infinite source scenario. Equations used to calculate Tier I and Tier II SSLs and MLSSLs are provided below in the Section B.2.3.

The spreadsheet model VZCOMML© was developed at SRS to facilitate SSL calculations and Tier I/Tier II soil data CM screening. VZCOMML© simultaneously calculates SSLs for TAL/TCL constituents and for specified radionuclides (a total of 219 constituents). VZCOMML© compares user-entered soil concentrations (i.e., maximum values, 95% UCLs) to calculate SSLs and identifies constituents that are Tier I CM COPCs and Tier II CM COCs. Chemical properties of analytes used by VZCOMML© (e.g., soil/water distribution coefficient [K_d], Henry's Law constant [H', H], etc.) for the 31 USCs identified for the Automotive Repair Shop (716-A) OU are listed in Table B-1. VZCOMML© also contains assigned hydraulic functions for different types of soil layers (e.g., source layer, soil layer, or engineered barrier layer) and texture classifications (e.g., sand, loamy sand, clay, concrete) within the soil column. The Tier II screen completed by VZCOMML© also uses soil concentrations input by the user to calculate maximum groundwater concentrations and migration times.

If Tier II CM COCs are identified, it is up to the user to evaluate results and apply professional judgment, other modeling approaches, and/or knowledge of site conditions and geochemistry to further refine the list of CM COCs in an uncertainty discussion (Section B.2.6). Constituents that are retained following the uncertainty discussion are CM refined COCs (RCOCs), which are constituents that are mobile at that waste unit, can leach to the aquifer within a 1,000-yr travel time (SRNS 2023), and are predicted to exceed drinking water standards at a receptor well located adjacent to the edge of the waste unit within the T_e.

B.2.3 Soil Screening Equations

Equations used by VZCOMML© (WSRC 2007) are consistent with USEPA Soil Screening Guidance (USEPA 1996, 2000). A conceptual framework of the model and vadose zone and screening parameters for VZCOMML© is provided in Figure B-1. Model assumptions include:

- A receptor drinking water well at the downgradient edge of the source zone with the well screen located in the plume.
- Linear equilibrium isotherms were used rather than exponential isotherms (this is typically a conservative estimate [i.e., likely transports more contaminant to water table] of partitioning into the aqueous phase of a moving front).
- Uniformly distributed contamination in the subsurface (this is also typically a conservative estimate using the input concentration across the entire unit for each constituent).
- Instantaneous equilibrium partitioning within soil, vapor, and liquid phases (this is typically a conservative estimate [i.e., likely transports more contaminant to water table] of partitioning into the aqueous phase of a moving front for compounds that have lower Henry's Law constants).

In the VZCOMML© model construction, the source zone layer thickness represents the vertical extent of contamination. Generally, Layer 1 is the source zone and Layers 2 through 5 (if applicable) are the vadose zone layers beneath the source zone and are used to simulate soil heterogeneity in the soil column. These layers can accommodate different hydraulic functions, soil textures, properties, and layer thicknesses for up to five total soil layers (including source layer). The aquifer layer represents the shallowest water table aquifer. Following is a discussion of the equations used by VZCOMML© for the soil screening process.

B.2.3.1 Dilution Attenuation Factor

The dilution attenuation factor (*DAF*) represents leachate dilution in the water table aquifer. The *DAF* calculation assumes that the aquifer is unconfined, unconsolidated, isotropic, and homogeneous. The minimum *DAF* is one, which indicates no dilution occurs in the aquifer. The USEPA recommends a default *DAF* of 20 for sites up to 0.2 hectare (ha) (0.5 acre [ac]) whenever

site-specific data are not available (USEPA 1996). It should be noted that the footprint of the building remnant concrete slab is 1.5 acres or three times the size used for USEPA estimation. Therefore, the DAF is anticipated to be much larger than the recommended value of 20 for sites up to 0.5 acres. The *DAF* (dimensionless) is calculated as follows:

$$DAF = 1 + \frac{K_a \cdot i \cdot d}{I \cdot L}$$

where;

K_a = saturated zone (aquifer) hydraulic conductivity (feet per year [ft/yr])

i = saturated zone (aquifer) hydraulic gradient (feet/feet [ft/ft])

I = infiltration rate through vadose zone (ft/yr)

L = length of the source (parallel to groundwater flow) (ft)

d_a = measured saturated zone (aquifer) thickness (ft)

d_i = calculated mixing zone depth (ft)

d = mixing zone depth (minimum of d_i and d_a) (ft)

If the input infiltration rate through the vadose zone is greater than any of the individual vadose zone layer saturated hydraulic conductivities, then the infiltration rate is adjusted to the maximum of the individual vadose zone layer saturated hydraulic conductivities. The calculated mixing zone depth (d_i) is defined as follows:

$$d_i = \sqrt{0.0112 \cdot L^2} + d_a\left(1 - e^{\left(-L \cdot I/(K_a \cdot i \cdot d_a)\right)}\right)$$

The actual mixing zone depth (d) value cannot exceed the actual aquifer thickness (d_a). Therefore, the mixing zone depth is the minimum of d_i or d_a. This can tend to underpredict localized contaminant concentrations in groundwater by immediately diluting the concentrations over the full aquifer extent when the contaminant reaches groundwater but is adjustable to accommodate mixing or lack thereof.

B.2.3.2 Soil Partitioning

The SSL soil concentration is back-calculated by two methods: 1) SSL (infinite source) and 2) MLSSL (finite source). The Tier I SSL assumes an infinite source and uses a linear equilibrium soil-water partitioning isotherm. The Tier I SSL (*TierI_SSL*, milligram per kilogram [mg/kg]) is calculated for organic contaminants and mercury (with vapor phase) as follows:

$$TierI_SSL = \frac{MCL}{1000} \cdot DAF \cdot \left[K_d + \frac{(\theta_w + \theta_a \cdot H)}{\rho_b}\right]$$

where;

MCL = water-phase concentration limit standard (i.e., MCL or regional screening level [RSL]) (micrograms per liter [µg/L])

K_d = soil-water partitioning coefficient (liter per kilogram [L/kg])

θ_w = water-filled soil porosity (unitless)

n_t = total porosity (unitless)

θ_a = air-filled soil porosity (unitless), $\theta_a = n_t - \theta_w$

H = Henry's Law constant (dimensionless)

ρ_b = dry soil bulk density (kilogram per liter [kg/L])

The Tier I SSL (*TierI_SSL*, mg/kg) equation for inorganic contaminants (without vapor phase) is:

$$TierI_SSL = \frac{MCL}{1000} \times DAF \times \left(K_d + \frac{\theta_w}{\rho_b}\right)$$

where;

t = time of exposure (USEPA default value of 30 yrs)

λ = decay rate constant ($\frac{\ln(2)}{t_{1/2}}$ [yrs^{-1}])

$t_{½}$ = half-life (yrs)

For organic constituents, the soil-water partitioning coefficient (K_d) (L/kg) is defined by:

$$K_d = f_{OC} \cdot K_{OC}$$

where;

f_{oc} = soil organic carbon content as mass fraction (unitless)

K_{oc} = organic carbon partitioning coefficient (L/kg)

For metals, the K_d is taken from literature and is dependent on the chemical form that exists and the geochemical environment at each site. Normally, the K_d is derived from laboratory column studies. K_d values for metals were determined from the 2021 *Geochemical Data Package for Performance Assessment Calculations Related to the Savannah River Site* (Kaplan 2021), using the most appropriate values for the specific vadose zone soil type. The water-filled soil porosity (θ_w) is based on a weighted average for all vadose zone layers and calculated as follows:

$$\theta_w = \sum_{i=1}^{n} \left(\frac{T_{hi}}{T_c}\right) \theta_{wi}$$

where;

T_{hi} = layer i vertical thickness (ft)

T_c = total depth of soil column (ft), $T_c = (d_s + L_v)$

d_s = average source thickness (ft)

L_v = length from the bottom of the source zone to the top of the water table (ft)

θ_{wi} = layer i water-filled soil porosity (unitless)

The soil texture is determined for the different layers or soil types observed in the vadose zone, and the soil layer parameters are used to calculate the volumetric water content as follows:

$$\theta_{wi} = n_{ti} \left(\frac{I}{K_{si}}\right)^{\left[\frac{1}{(2b_i+3)}\right]}$$

where;

n_{ti} = layer *i* total porosity (unitless)

K_{si} = layer *i* Clapp and Hornberger "*K*" parameter based on soil texture (ft/yr)

b_i = layer *i* Clapp and Hornberger "*b*" parameter based on soil texture (dimensionless)

The vadose zone total porosity (n_t, unitless) and vadose zone effective porosity (n_e, unitless) are both based on a weighted average for all vadose zone layers and calculated as follows:

$$n_t = \sum_{i=1}^{n} \left(\frac{T_{hi}}{T_c}\right) \times n_{ti}$$

$$n_e = \sum_{i=1}^{n} \left(\frac{T_{hi}}{T_c}\right) \times n_{ei}$$

where;

n_{ei} = layer *i* effective porosity (unitless)

The effective moisture content θ_e (fraction) is a weighted average for all vadose zone layers as follows:

$$\theta_e = \sum_{i=1}^{n} \left(\frac{T_{hi}}{T_c}\right) \times \theta_{ei}$$

where;

θ_{ei} = layer *i* effective moisture content (unitless)

To solve the mass-balance violations inherent in the infinite source equation, USEPA developed the MLSSL (*TierI_MLSSL*, mg/kg) for organics and metals as follows:

$$TierI_MLSSL = \frac{MCL}{1000} \cdot DAF \cdot \frac{I \times ED}{(\rho_b \times d_s)}$$

where;

ED = exposure duration (yr [USEPA default value of 70 yrs])

B.2.3.3 Mean Travel Time

The mean travel time (T_{Mean} or T_t, yrs) through the vadose zone layers below the source is calculated in VZCOMML© as follows:

$$T_{Mean} = \frac{L_v \cdot R}{V_s}$$

The retardation coefficient (R, dimensionless) is calculated as:

$$R = 1 + \frac{\left(K_d \cdot \rho_\beta\right)}{\theta_e}$$

The mean pore water velocity in the vadose zone (V_s, ft/yr) is a weighted average calculated by:

$$V_s = \sum_{i=1}^{n} \left(\frac{T_{ti}}{T_t}\right) \cdot V_{si}$$

where;

V_{si} = layer i mean pore water velocity (ft/yr)

T_{ti} = layer i mean travel time (yr)

T_t = travel time (yr)

By applying Darcy's Law in the unsaturated zone and assuming steady-state conditions;

$$V_{si} = \frac{\mathrm{I}}{\theta_{wi}}$$

Darcy's Law is not applicable to unstable vadose zone flow, which typically exhibits fingering and other nonlinear behavior, however over most areas this method will typically be a conservative one (i.e., likely transports more contaminant on average to the water table) assuming appropriate hydraulic conductivity values are selected. One pitfall is that preferential pathways are not uncommon and can rapidly transport water (and contaminant) faster than Darcy-derived flow in small, localized areas.

B.2.3.4 Incorporating Decay

To account for chemical degradation, hydrolysis, or biodegradation of constituents and for redistribution of mass in the vadose zone, the Tier I SSLs and Tier I MLSSLs are adjusted using first-order equations in the Tier II $SSL_{T1/2}$ ($TierII_SSL_{T1/2}$) and Tier II $MLSSL_{T1/2}$ ($TierII_MLSSL_{T1/2}$) as follows:

$$TierII_SSL_{T1/2} = \left(\frac{TierI_SSL}{e^{(-\lambda T_{Mean})}}\right) \cdot \left(\frac{T_c}{d_s}\right)$$

$$TierII_MLSSL_{T1/2} = \frac{TierI_MLSSL}{e^{(-\lambda ED)}}$$

where;

T_{Mean} = the mean travel time (yr)

A half-life ($T_{1/2}$, $t_{1/2}$) for a chemical compound is largely determined from literature sources. Because there is usually variability of the reported half-life of a chemical compound (e.g., aerobic and anaerobic rates), the most conservative (longest) half-life is selected as the rate constant in the equations. The rate constants used in the VZCOMML© model are primarily derived from the publications of P. H. Howard, et al (1991) and Looney et. Al (1987), but other references were also used such as USEPA's Estimation Program Interface Suite software (USEPA, 2012) and USEPA's Human Health Risk Assessment Parameters database.

VZCOMML© assumes equilibration, mass redistribution, and conservation of mass in the source zone between phases (i.e., volatilized, dissolved, or sorbed) and throughout the entire vadose zone volume. This results in more realistic SSLs, which accounts for vadose zone thickness, travel time, and chemical behavior in the subsurface.

The VZCOMML© Tier II screening decision logic for a constituent 'fails' if: 1) the mean travel time (T_{Mean}) through the vadose zone is less than 1,000 yrs, and 2) the source concentration exceeds the Tier II $MLSSL_{T1/2}$, and 3) the groundwater concentration exceeds an action level (i.e., the calculated concentration in groundwater would exceed the regulatory limit, such as MCLs or

RSLs). In this case, the constituent would be retained as a CM COC and subject to further CM COC refinement steps.

B.2.3.5 Saturation Concentration

For organic (non-radioactive) constituents, the saturation concentration (C_{sat}) (mg/kg) is calculated from the solubility constant in water (S) (milligrams per liter [mg/L]) as follows:

$$C_{sat=}\frac{S}{\rho_b}\cdot(K_d+\rho_b+\theta_w+H\cdot\theta_a)$$

The C_{sat} is a theoretical concentration that represents a pure non-aqueous phase liquid (NAPL) or solid threshold concentration in soil. The C_{sat} is compared to the detected concentration to predict if a NAPL phase compound is present in the soil.

B.2.3.6 Groundwater Concentration

The concentration of constituents in groundwater in the water table aquifer is directly calculated by VZCOMML© for comparison to groundwater regulatory limits. The groundwater concentration (C_{gw} [µg/L]) is calculated as follows (SRNS 2011):

For organic contaminants (including mercury with vapor phase);

$$C_{gw}=\frac{\left(\frac{C_t\cdot 1000}{DAF}\right)\times e^{(-\lambda T_{mean})}}{\left(K_d+\frac{(\theta_w+H\cdot\theta_a)}{\rho_b}\right)\times\left(\frac{\lambda t}{1-e^{(-\lambda t)}}\right)}\cdot\left(\frac{d_s}{T_c}\right)$$

where;

C_t = input contaminant soil concentration (mg/kg)

For inorganic contaminants (including metals [note: metals use an infinite half-life] and excluding mercury with vapor phase):

$$C_{gw}=\frac{\left(\frac{C_t\cdot 1000}{DAF}\right)\cdot e^{(-\lambda T_{mean})}}{\left(K_d+\frac{\theta_w}{\rho_b}\right)\cdot\left(\frac{\lambda t}{1-e^{(-\lambda\ )}}\right)}\cdot\left(\frac{d_s}{T_c}\right)$$

VZCOMML© assumes equilibration, redistribution, and conservation of mass of the source between phases (i.e., volatilized, dissolved, or sorbed) and distribution throughout the entire vadose zone volume. The concentration of constituents in groundwater in the water table aquifer is directly calculated by VZCOMML© for comparison to groundwater regulatory limits or standards.

B.2.4 Modeling Parameters

Vadose zone CM simulation using the VZCOMML© spreadsheet is presented in this section for the Automotive Repair Shop (716-A) OU. The vadose zone soil layers for the Automotive Repair Shop (716-A) OU were modeled based on the best available data from previous soil boring activities, as well as recent soil core descriptions (Appendix G). The layers were modeled as shown in Table B-2.

These steps were used to perform the CM analysis:

1. Analytical soil data were compiled and evaluated. The data were processed to purge all quality assurance data and rejected (R qualified) data. The data were further processed to select the maximum detected concentration and the 95% upper confidence limit (UCL) for each analyte (Appendix A). The 95% UCL was determined by ProUCL (USEPA 2022).

2. A conceptual site model was developed, which includes a soil layer above the contamination, a source zone (ending at the depth of contamination), a vadose zone below the contamination up to the estimated water table and assigned values for several hydrogeological parameters, presented in Table B-3 and B-4.

3. VZCOMML© Tier I screen was performed, using two conservative assumptions: a) for each analyte, the 95% UCL soil concentration was used to represent the soil concentration (C_t), and b) the thickness of the source zone was assumed to be equal to the depth of the deepest available soil sample with maximum detected concentration. An analyte was retained as a Tier I CM COPC if the source zone concentration was greater than both the Tier I Source-Specific SSL and the Tier I MLSSL. No Tier I CM COPCs were identified in the analysis.

4. VZCOMML© Tier II Simulation was planned to be run, using two conservative assumptions: (a) for each analyte, the 95% UCL soil concentration was used to represent the soil concentration (C_t), and (b) the thickness of the source zone was assumed to be equal to the depth of the deepest available soil sample. Analytes predicted to impact groundwater at concentrations exceeding action levels within the evaluation time of 1,000 yrs, under the conservative conditions simulated, were retained as Tier II CM COPCs. Action levels refer to the Tier II $SSL_{T1/2}$, the Tier II $MLSSL_{T1/2}$, and either the November 2024 USEPA MCL or RSL. For an analyte to be retained as a Tier II CM COPC in VZCOMML©, the "predicted concentration in aquifer" must be greater than all three action levels, and the analyte must have a mean travel time of less than 1,000 yrs. No Tier II simulations were required since no Tier I CM COPCs were identified.

5. CM COCs were not evaluated further using additional lines of inquiry since there were no exceedances in the Tier I analysis. However, an Uncertainty Discussion (Section B.2.6) is included to summarize the limitations of the analysis.

6. No Screening-level CM remedial goal options (RGOs) were identified since no COCs exceeded the SSL in Tier I analysis.

Table B-1 presents chemical and physical property parameters for each evaluated analyte. These parameters include organic carbon partitioning coefficient (K_{oc}), soil-water partitioning coefficient (K_d), half-life (biological degradation for organics), Henry's Law constant (H', H), solubility (S), and regulatory action level (USEPA MCL or RSL). The RSLs used were for resident tap water with a target hazard quotient (THQ) of 1.0. In addition to chemical parameters, several physical parameters are also employed in CM simulations. The physical parameters are presented in Table B-3. Other hydrogeologic physical parameters related to the location of contamination and flow parameters are presented in Table B-4.

B.2.5 Results of the Tier I and Tier II Analyses

In this section, results of the Tier I and Tier II screening are presented for the Automotive Repair Shop (716-A) OU. Constituents that did not undergo SSL calculations include those compounds which lack both MCLs and RSLs (e.g., Di-n-octyl phthalate), and constituents that are essential

nutrients (e.g., calcium, magnesium, potassium, and sodium). These analytes did not undergo CM COC evaluation and were listed as "NA" in Table B-5. However, travel times and groundwater concentrations were predicted for the compounds which lack MCLs/RSLs and are not essential nutrients presented in Table B-6.

None of the 31 constituents considered in the screening analysis failed the Tier I screen (Table B-7). Therefore, no Tier II simulations were conducted.

B.2.6 Uncertainty Discussion

No analytes considered in the screening analysis were found to exceed the SSL. Therefore, no additional lines of inquiry were pursued during the screening analysis. It should be noted that VZCOMML© is built on conservative assumptions that should tend to overestimate the amount of contaminant migration to the water table. The modeling team also made some conservative estimates while selecting the modeling parameters. The source zone was estimated as extending from the highest to the lowest depth at which maximum concentration of any contaminant was detected (5 ft – 140 ft bgs) or for that entire interval of 135 feet thickness. The depth of the water table was also assumed, conservatively, as just five (5) feet below the source zone. These conservative assumptions should cover the limitations which are inherent in any mathematical approximation of natural processes. Therefore, no further evaluation is warranted for the Automotive Repair Shop (716-A) OU.

B.3 CONCLUSIONS

This CM analysis performed using VZCOMML© resulted in no soil contaminants in the vadose zone with the potential to migrate to groundwater and exceed groundwater action levels within 1,000 yrs. Therefore, no CM RCOCs were retained. Table B-7 summarizes the Tier I and Tier II screening results.

C-1. INTRODUCTION

The human health risk assessment (HHRA) in support of the Remedial Investigation Report with Baseline Risk Assessment (BRA) for the Automotive Repair Shop (716-A) Operable Unit (OU) presented in this appendix is not the initial baseline risk assessment for the Spray Paint Room remnant concrete slab. Rather, this evaluation provides an update to the human health risk assessment reported in the *Decommissioning Project Final Report 716-A, Automotive Repair Shop* (WSRC 2005a) to assess the risks of contamination to human receptors to identify the problems warranting action from a human health standpoint to support subsequent remediation as deemed necessary.

The Automotive Repair Shop (716-A) OU is located in A Area in an area currently designated for industrial use as defined by the SRS Land Use Control Assurance Plan (WSRC 1999). The Automotive Repair Shop (716-A) OU is a Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)-only unit and is listed in Appendix C.4, D&D Facilities (or Remnants) That May Warrant Response Action of the Federal Facility Agreement (FFA) (FFA 1993). No current or projected future development of the OU is planned, nor is the current land use expected to change. Nevertheless, to support the risk management decision-making, both the residential (unrestricted) and industrial worker scenarios are evaluated.

The Automotive Repair Shop (716-A) OU was decommissioned using the Deactivation and Decommissioning (D&D) Integrated Sampling Model (ISM) in the 2004-2005 timeframe. Because chemical operations at the Automotive Repair Shop (716-A) only took place in the Spray Paint Room, the post-decommissioning final verification survey was restricted to the Spray Paint Room remnant concrete slab. The *Decommissioning Project Final Report 716-A, Automotive Repair Shop* (WSRC 2005a) documents the risk assessment that was conducted on the remnant concrete slab, concluding that there were no problems warranting remedial action to human receptors. As agreed to by the Core Team (i.e., United States Department of Energy, U.S. Environmental Protection Agency [USEPA] and the South Carolina Department of Environmental Services [SCDES]) at the June 2025 scoping meeting, the strategy for the Automotive Repair Shop (716-A) OU is to use the information and conclusions of the Decommissioning Project Final Report (DPFR) and provide an update of the risk assessment using current SRS Environmental

Compliance & Area Completion Projects (EC&ACP) risk evaluation protocols and methodology (SRNS 2023) to verify that the conclusions of the DPFR risk evaluation.

C-1.1 Background

The Automotive Repair Shop (716-A) OU was used as an automotive repair facility containing service bays with offices, related storage areas, mechanical, and electrical rooms. The building was erected on top of a concrete slab and occupied in 1953. Fluid/oil stains were found in the maintenance areas, lubrication pit (Room 103), side trench, hydraulic lifts, cylinders, and narrow trenches. Based on process knowledge, chemical operations only took place in the approximately 738 square feet Spray Paint Room.

The Automotive Repair Shop (716-A) OU was decommissioned using the D&D ISM in the 2004-2005 timeframe. Fluid/oil stains that were part of routine operation of Automotive Repair Shop (716-A) were removed, and the building structure was demolished to the remnant concrete slab foundation. The DPFR (WSRC 2005a) concluded the building structure decommissioning activities have been completed, including waste disposal in accordance with federal and state regulations. The clean remnant concrete slab remains on its original footprint (Figure 1-2).

Because chemical operations only took place in the Spray Paint Room, the post-decommissioning final verification survey was restricted to the Spray Paint Room remnant concrete slab. The DPFR (WSRC 2005a) documents the assessment that was conducted on the Spray Paint Room remnant concrete slab following protocols that were developed by the Savannah River National Laboratory (SRNL) (i.e., comparison to SRNL Derived Concentration Guideline Levels [DCGLs]). The total cumulative risk (TCR) risk to an industrial worker exposed to the remnant concrete slab was estimated to be 4.36E-07. The non-cancer hazard index (HI) for the remnant concrete slab was estimated to be 0.049.

The risk information presented in the DPFR followed protocols that were developed by the SRNL (i.e., comparison to SRNL DCGLs) in the 2004-2005 timeframe. It was uncertain if the conclusion of the DPFR risk evaluation were still valid since the risk evaluation process presented in historical D&D documents do not align with the current SRS EC&ACP methodology for evaluating human health risk. To address this uncertainty, updating the D&D risk assessment using current EC&ACP

risk evaluation protocols and threshold values (SRNS 2023) is the subject of the HHRA presented in this appendix.

A quantitative ecological risk assessment for the Automotive Repair Shop (716-A) is not warranted. The remnant concrete slab does not provide any appreciable habitat, and a survey of the surrounding area indicates the physical setting does not provide adequate habitat for population level impacts to wildlife receptors since it is very small in size and located in an industrial setting. There are no problems warranting action from an ecological risk perspective.

C-1.2 Data

The dataset used for the HHRA risk/hazard calculations were concrete samples collected in the Spray Paint Room for the D&D final verification survey (WSRC 2005b). Sixteen (16) sample locations composited in four sets of four samples were obtained for Resource Conservation and Recovery Act (RCRA) metals analysis (arsenic, barium, cadmium, chromium, lead, mercury [elemental], mercury [compounds], selenium, and silver) (Figure 1-5). Nine single samples were taken for volatile organic compounds (VOC) analysis (Figures 1-6) . As agreed by the Core Team during the June 2025 scoping meeting, the D&D final verification survey data was sufficient to support the update of the risk evaluation, and no additional data needs were identified.

The investigative data reported in Appendix A for subsurface soils (all depths) collected beneath the Automotive Repair Shop (716-A) storm sewer lines and the 103 Lubrication Pit are not part of the HHRA update. This data supports the contaminant migration analysis in Appendix B and the PTSM evaluation presented in Appendix D. In addition, groundwater is not part of this OU. Groundwater will be investigated and remediated, as applicable, under the RCRA corrective action program defined in the SRS RCRA Permit Renewal for the M-Area and Metallurgical Laboratory Hazardous Waste Management Facilities.

C-1.3 Receptors

The receptors evaluated in the updated HHRA include the future resident (unrestricted use) and future industrial worker. A description of each is presented below.

The future resident receptor scenario evaluates long-term risks to individuals assumed to have unrestricted use of the Spray Paint Room remnant concrete slab area. This scenario considers residents (adults and children) that hypothetically live on the Automotive Repair Shop (716-A) OU and are exposed chronically to OU contaminants. The standard exposure assumptions are 26 years, 350 days per year, and 24 hours per day. Exposure routes associated with the concrete media include inhalation of particulates and vapors, external exposure to radiation, dermal absorption, and incidental ingestion.

The future industrial worker scenario is a standard USEPA exposure scenario that addresses long-term risks to workers who are exposed to OU contaminants within an industrial setting. The standard exposure assumptions are 25 years, 250 days per year, and 8 hours per day. This receptor is referred to as "composite worker" by USEPA and is analogous to the term "industrial worker" used herein. The future industrial worker scenario considers an adult who hypothetically works on-unit in an outdoor setting for the majority of time. Exposure routes include inhalation, external exposure to radiation, dermal absorption, and incidental ingestion.

C-1.4 Sources of Risk-Based Threshold Values

The USEPA publishes regional screening levels (RSLs) for nonradiological constituents and preliminary remediation goals (PRGs) for radiological constituents that are risk-based concentrations (or activity concentrations) that can be used to evaluate potentially contaminated waste sites. Both RSLs and PRGs combine current USEPA toxicity values with standard exposure factors that represent reasonable maximum exposure (RME) conditions to estimate contaminant concentrations in exposure media that the agency considers protective of humans over a lifetime. The concentrations are based on direct exposure pathways for which generally accepted methods, models, and assumptions have been developed for specific land use conditions.

The USEPA RSLs website (USEPA 2024) is the source of the November 2024 USEPA RSLs for nonradiological constituents used in this evaluation. The website was accessed in April 2025. The default resident and industrial worker RSLs are provided in Attachment C-1.

The Automotive Repair Shop (716-A) was a nonradiological building. Therefore, radiological risks for the Spray Paint Room remnant concrete slab were not considered.

C-2. HUMAN HEALTH RISK ASSESSMENT PROCESS

The strategy for the HHRA for this RI/BRA is to update the risk evaluation reported in the DPFR for the Spray Paint Room remnant concrete slab by applying the approved EC&ACP protocols for the human health risk assessment (SRNS 2023) and November 2024 USEPA RSLs. The maximum detected concentration of each analyte in the Spray Paint Room is used to provide the most conservative risk/hazard result.

Per SRS protocols, RSLs for soil media are multiplied by ten (10x) to obtain thresholds for concrete media. This conversion acknowledges that the exposure assumptions for competent, hardened concrete are different from (i.e., less than) the exposure assumptions for more friable soil media. As defined by CERCLA, a risk of less than 1.0E-06 and a hazard quotient (HQ) of less than 1 were used as the maximum acceptable risk thresholds for the residential and industrial worker risk scenarios.

C-2.1 Risk/Hazard Calculation

Risk and hazard estimate calculations for the reevaluation of the Spray Paint Room remnant concrete slab are based on the maximum detected concentration.

The risk estimates for constituents are calculated using the following equation:

$$risk\ estimate = \left(\frac{[Maximum\ Concentration]}{[RSL\ or\ PRG]}\right) \times 1E\text{-}06$$

The risk estimates are then summed to provide the total risk by grouping. The total media risk is the sum of the total groupings. Constituents with an individual cancer risk greater than 1E-06 are identified as constituents of concern (COCs) and are further evaluated in the refinement of COCs step (i.e., uncertainty evaluation).

For noncarcinogens, hazard estimates (or HQs) are calculated individually for each nonradiological constituent using the following equation:

$$hazard\ estimate\ (HQ) = \frac{[Maximum\ Concentration]}{[RSL]}$$

Individual constituent HQs are summed to provide the total HI. If the total HI is less than 1, then no COCs are identified. If the total HI is greater than 1, then the constituents are segregated based on relevant target organ or system toxicity, and the grouped constituent HQs are summed. Constituents are identified as COCs if the constituent organ/system HQ is greater than 0.1 and the total organ HI is greater than 1. Constituents identified as COCs are further evaluated in the refinement of COCs step (i.e., uncertainty evaluation).

C-2.2 Risk/Hazard Evaluation Results

Table C-1 presents the updated risk evaluation for the Automotive Repair Shop (716-A OU) Spray Paint Room remnant concrete slab. The updated residential scenario had a noncarcinogenic HI=0.9 and cancer TCR=4E-07. The updated industrial worker scenario had an HI=0.05 and TCR=9E-08. Because no COCs were identified, no uncertainty evaluation was needed.

C-3. SUMMARY/CONCLUSION OF THE HUMAN HEALTH RISK ASSESSMENT

The updated risk evaluation confirmed the conclusions of the DPFR that there are no problems warranting action for human receptors at the Automotive Repair Shop (716-A) Spray Paint Room remnant concrete slab. The risk from the updated HHRA are within acceptable limits and did not exceed the risk management range of 1E-06 to 1E-04 from the National Oil and Hazardous Substances Pollution Contingency Plan (40 CFR 300.430(e)(2)(i)(A)(*2*)) (USEPA 1990). As previously stated, the remnant concrete slab and surrounding area does not provide any appreciable habitat for ecological receptors and a quantitative ecological risk assessment is not warranted. The refined conceptual site model based on the results of the HHRA are presented in Section 3.9.

D.1. INTRODUCTION

The concept of principal threat waste and low-level threat waste as developed by the U.S. Environmental Protection Agency (USEPA) in the National Contingency Plan (40 *Code of Federal Regulations* 300.430(a)(1)(iii)) is to be applied on a site-specific basis when characterizing source material. Source materials are those materials that include or contain hazardous substances, pollutants, or contaminants that act as a reservoir for migration to surface water or air, or that act as a source for direct exposure (USEPA 1991).

The determination of whether the source materials present at a waste unit would be classified as principal threat source material (PTSM) is based mainly on the USEPA guidance document (USEPA 1991). In this guidance, the USEPA defines principal threat wastes as "those source materials considered to be highly toxic or mobile that generally cannot be reliably contained or would present a significant risk to human health or the environment should exposure occur." These include liquids and other highly mobile materials (e.g., materials that released from surface soil due to volatilization, leaching, or surface runoff) or materials having high concentrations of toxic compounds. No "threshold level" of toxicity/risk has been established to equate to "principal threat." However, the guidance does state that treatment alternatives for source materials should generally be evaluated where the combined toxicity and mobility pose a potential risk of 1E-03 or greater, or a hazard index (HI) of 10 or greater. According to USEPA, the PTSM concept expectation was to "help streamline and focus the remedy selection process, not as a mandatory waste classification requirement."

The USEPA, South Carolina Department of Environmental Services (SCDES), and U.S. Department of Energy (USDOE) evaluated the USEPA guidance with respect to toxicity and contaminant migration analysis performed at Savannah River Site (SRS). In practice, SRS risk assessment and contaminant migration evaluations identify constituents of concern (COCs) associated with source material or impacted media and determine the associated risk (i.e., adverse health impacts as measured by the HI and numerical estimate of risk) or potential impact to environmental media. If threshold risk levels are exceeded, problems are identified, and an evaluation of remedial alternatives is conducted in the Feasibility Study. Since the risk assessment does not evaluate human receptor exposure to subsurface soils, further reevaluation is needed to account for potentially highly toxic source material or contaminated soils at depth that would result

in unacceptable risk should exposure occur. Therefore, a quantitative determination of whether contamination exists above PTSM levels at the Automotive Repair Shop (716-A) Operable Unit (OU) in all soil depths was performed.

D.1.1 Background

The Automotive Repair Shop (716-A) OU consisted of a structural steel frame building, built on a concrete slab with an area of approximately 3,900 square meters (42,000 square feet). The building was used as an automotive repair shop containing service bays with offices, related storage areas, mechanical, and electrical rooms. This facility also contained many vehicle lifting systems, battery charging and storage room, brake repair area, spray paint room, and lubrication pit. The building structure decommissioning and demolition was completed in 2005, leaving the concrete pad in place. The remnant concrete pad was considered clean based on the final verification survey and reporting in the Decommissioning Project Final Report (DPFR) (Westinghouse Savannah River Company [WSRC] 2005a, WSRC 2005b). In the October 2023 scoping meeting, the Core Team (i.e., USDOE, USEPA, and SCDES) agreed that the DPFR conclusions were valid, and the remnant concrete slab posed no threat to human health or the environment and therefore presented no problems warranting action (Savannah River Nuclear Solutions, LLC [SRNS] 2023b). The Core Team agreed additional sampling of soil beneath the Automotive Repair Shop (716-A) OU remnant concrete slab was warranted, specifically below sewer drain lines and the 103 Lubrication Pit to support a PTSM evaluation and contaminant migration analysis. The Revision 1 Remedial Investigation Work Plan was approved in May 2024 and field work was completed in December 2024 (SRNS 2024). Six borings were completed and sampled to characterize soil beneath the Automotive Repair Shop (716-A) OU remnant concrete slab (Figure D-1). Chapter 1 through Chapter 3 of this document provide detailed descriptions of the OU and characterization.

D.1.2 Data

Appendix A presents the maximum detected constituent concentrations from the all-depths soil interval for the Automotive Repair Shop (716-A) OU soil (Table A.2.1) used in the PTSM evaluation.

D.1.3 Receptor

The USEPA default industrial worker scenario (termed composite worker) is the receptor scenario evaluated under this PTSM evaluation for the Automotive Repair Shop (716-A) OU. The principal exposure assumptions for the industrial worker are 25 years, 250 days per year, and 8 hours per day. Given the current and expected future land use of the area in which the Automotive Repair Shop (716-A) OU is located, the industrial worker is the most likely receptor exposure scenario.

D.1.4 Sources of Risk-Based Threshold Values

The *USEPA Regional Screening Levels* website (USEPA 2024) is the source of risk-based threshold values for nonradiological constituents used in this evaluation. The website was accessed in April 2025. The industrial worker regional screening levels (RSLs) are provided in Attachment D-1.

D.2. PTSM EVALUATION PROCESS

To determine whether contaminated source material/soils should be preliminarily considered PTSM, a simple quantitative assessment evaluating the toxicity of the source is used where the results are compared to a threshold for determining PTSM. The PTSM evaluation is performed in accordance with the approved Environmental Compliance & Area Completion Projects protocol, Evaluation of PTSM at SRS Waste Units (SRNS 2023a).

In determining whether the source should be considered PTSM, the evaluation considers the cumulative effects of both the potential risk from carcinogenic constituents and the adverse effects from noncarcinogens to an industrial worker receptor. The source material (i.e., soil) is preliminarily considered to be PTSM if the cumulative risk exceeds at least one of the following threshold screening criteria:

- Carcinogens – greater than 1E-03 industrial worker risk
- Noncarcinogens – industrial worker HI greater than 10

In the preliminary screen, the unit maximum concentration for every detected constituent for the soil media from the all-depths soil interval for the Automotive Repair Shop (716-A) OU is determined and used as the exposure point concentration (EPC).

For carcinogens, the individual risk associated with each constituent is calculated by multiplying the ratio of the EPC to the RSL by 1E-06. Each of these risks is summed to calculate the cumulative carcinogenic risk associated with the source. For noncarcinogens, a hazard quotient (HQ) associated with each constituent is calculated by dividing the EPC by the RSL. These HQs are summed to derive the cumulative HI. If neither threshold criteria for PTSM are exceeded based on the maximum detected concentrations, then PTSM is not present, and it is not necessary to evaluate further. If the threshold criteria are exceeded, then an uncertainty analysis may be conducted to further evaluate the constituents and source that exceed the PTSM toxicity criteria.

D.2.1 Screening Evaluation

For the screening evaluation for PTSM, maximum concentrations for nonradiological constituents were used to calculate HQs for noncarcinogens and numerical risk for carcinogens. The following equations are used to calculate HQs and risks for the PTSM evaluation:

$$noncarcinogen\ hazard\ quotient = \frac{[Maximum\ Concentration]}{[RSL]}$$

$$carcinogen\ risk\ estimate = \left(\frac{[Maximum\ Concentration]}{[RSL]}\right) \times 1E\text{-}06$$

D.2.2 Results

Table D-1 presents the results of the PTSM screening evaluation for soil at the Automotive Repair Shop (716-A) OU. Results of the PTSM evaluation for soil at the Automotive Repair Shop (716-A) OU indicate that the HI is 6.57E-01 and the cumulative risk is 1.09E-05. No PTSM refined COCs are identified for the Automotive Repair Shop (716-A) OU soil media.

D.3. SUMMARY AND CONCLUSIONS

Based on the results of the PTSM evaluation, no PTSM refined COCs are identified for the Automotive Repair Shop (716-A) OU. The revised conceptual site model is presented in Chapter 3.

APPENDIX E

NATURAL RESOURCE INJURY EVALUATION CHECKLIST

.

This page is intentionally left blank.

NATURAL RESOURCE INJURY EVALUATION CHECKLIST

This checklist is provided to assist project teams in determining the potential for natural resource injuries in the conduct and planning of remedial activities. For the most part, the questions only require a simple 'yes/no' or 'to be determined' response. Some require a short answer or explanation. However, it is in the best interest of the project team to be as complete as possible and add any relevant information.

Five main areas are being evaluated, as follows:

- Are there potential natural resource injuries and what do they consist of?
- What are the potential impacts from implementing the remedial alternatives?
- Are there potential residual injuries that will not be addressed by the alternative?
- Would implementation of the alternative cause additional injuries?
- What potential irreversible and irretrievable resources may be identified?

The checklist may be re-visited and revised as CERCLA activities continue and additional information from the Automotive Repair Shop (716-A) OU becomes available.

1. Has a release of a hazardous substance occurred?

No. No HH, ecological, PTSM, or CM COCs were identified for the concrete slab or the soil beneath the Automotive Repair Shop (716-A) OU. There is no indication of any hazardous substances released that would cause a natural resource injury at the Automotive Repair Shop (716-A) OU.

2a. Have natural resources for which Federal or State agencies (or Indian Tribes) may assert trusteeship under CERCLA been or are likely to have been adversely affected by the release?

No. No COCs have been identified for the Automotive Repair Shop (716-A) OU, and there is no indication that a release has occurred.

2b. List the potentially affected resources (e.g., ground water, waterfowl, etc.).

None.

3. Is the amount of hazardous substance released sufficient to potentially cause a natural resource injury?

No. There is no indication of any hazardous substances released that would cause a natural resource injury at the Automotive Repair Shop (716-A) OU.

4. Will the remedial alternatives being considered, or action already taken, sufficiently address the injuries to natural resources (including residual injuries)?

Not applicable. The Automotive Repair Shop (716-A) OU was determined not to require a remedial action, as no problems warranting action were identified.

5. Will the remedial alternatives being considered produce additional impacts to natural resources during remediation?

No. There are no problems warranting action for the remnant concrete slab or soils beneath the Automotive Repair Shop (716-A) OU.

6. Identify any irreversible and/or irretrievable resource losses in the appropriate documentation.

Not applicable.

LIST OF ACRONYMS AND ABBREVIATIONS

FD	field duplicate
ft	feet
LCS	laboratory control sample
LD	laboratory duplicate
MCL	maximum concentration limit
MDL	method detection limit
MS	matrix spike
NBN	No Building Number
NST	no sample taken
PRG	preliminary remediation goal
QA	quality assurance
QAPP	Quality Assurance Project Plan
QC	quality control
RB	rinsate blank
REG	regular
RFI	RCRA Facility Investigation
RI	Remedial Investigation
RPD	relative percent difference
RSL	regional screening level
SPL	split
SQL	sample quantitation limit
SRNS	Savannah River Nuclear Solutions
ssEQL	sample specific estimated quantification limit
TB	trip blank

F.1 PROJECT SUMMARY

This report presents analytical data verification and validation for the FY25-716-A soil sampling event for investigation of the soil beneath the remnant concrete slab at the 103 Lubrication Pit and drain lines and/or sewer lines within the Automotive Repair Shop (716-A) Operable Unit. The sampling was conducted in accordance with the *Remedial Investigation Work Plan for the Automotive Repair Shop (716-A) Operable Unit (U)* (SRNS 2024). Six soil borings were identified for sampling. The project generated 70 regular field samples, four duplicate samples and four split samples. The samples, along with the requested analytical analyses, are listed in Table 1.

Table F-1. Sample Identification (ID) Summary

Sample ID	Station ID	Sample Type	Sample Date	Sample Time	Matrix	Interval (ft)	Analysis Requested
FY25-716A-00345	*ARS-001-SB*	*REG*	*11/21/24*	*0930*	*SOIL*	*5.5 – 5.5*	*1, 3, 4, 5, 6*

5. PCBs, EPA8082A
6. Mercury, Total Recoverable, EPA7471B
7. Mercury, Total Recoverable, EPA7470A

A total of 13,689 analytical records were produced consisting of 10,570 regular records and 3,119 Quality Control (QC) records. See Table 2.

Table F-2. Total Number of Records

Number of Records	Chemical	Radiochemical	Totals
Analytical	*10,570*	*0*	*10,570*
Field QC	*3,119*	*0*	*3,119*
Totals	*13,689*	*0*	*13,689*

The verification process was conducted to review completeness of the sampling and analytical requirements. Validation has been performed to assess compliance with methods, procedures, and contracts, and to assess a comparison with measurement performance criteria in the ER-SOP-033, *Analytical Data Qualification* (SRNS 2015). A usability assessment will provide the data user with an assessment of whether the process execution and resulting data meet project quality objectives in the Quality Assurance Project Plan (QAPP) (SRNS 2012) and the *Remedial Investigation Work Plan for the Automotive Repair Shop (716-A) Operable Unit (U).* These processes involve examination of the electronic data files, the field data, analytical data, and laboratory records. Computer programs are used to verify that samples were properly preserved and were analyzed within the required holding time, that QC results were within specified acceptable ranges, and that the appropriate detection limits were employed by the laboratories. Additionally, manual reviews of field data and laboratory records are conducted to ensure the quality of these items. Validation summaries for holding time, preservation, calibration, analyte identification, and analyte quantitation can be found in subsections 3.1, *Holding Times*; 3.2, *Preservation*; and 3.3, *Calibration, Identification, and Quantitation*.

The data were validated to determine if the records conform to the technical criteria associated with definitive data per ER-SOP-033 (SRNS 2015). Table 3 provides a brief validation summary for the project. Review qualifiers are assigned by a data validator internal to Savannah River Nuclear Solutions, LLC (SRNS) and external to the analytical laboratory. Environmental records include regular sample, split and field duplicate records.

F.2 ASSESSMENT OF PRECISION, ACCURACY, REPRESENTATIVENESS, COMPARATBILITY, AND COMPLETENESS DATA QUALITY INDICATORS (DQIS) AND MEASUREMENT PERFORMANCE CRITERIA

This section discusses the analytical data in terms of the following indicators of data quality: precision, accuracy, representativeness, comparability, and completeness. Precision is determined from the field and laboratory duplicate analyses and indicates the consistency of field and laboratory techniques. Accuracy is determined from the laboratory control samples (LCS), matrix spikes (MS) and the results of the method blanks, field, trip and rinsate blanks; it indicates the ability of the laboratory to generate correct results. Representativeness measures how well the data represents the sample population. Comparability expresses the confidence with which data from different laboratories are considered to be equivalent. Representative completeness measures the amount of data resulting from the data collection activity.

F.2.1 Precision

Precision is the degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves. Field duplicates measure the repeatability of the sampling and analytical techniques, and laboratory duplicates measure the ability of the laboratory to reproduce a result. Low precision can be caused by poor instrument performance, poor operator technique, inconsistent application of method protocols, laboratory environment, time between analyses, or by a difficult, heterogeneous sample matrix. Precision is especially important when the action limit approaches the quantification limit. A total of 6 % of

the samples were collected in duplicate for this project in accordance with the SAP. The laboratory performs duplicate analyses on at least 5% of the samples received.

Precision is expressed in terms of the relative percent differences (RPD) as follows:

$$\text{RPD} = \frac{|x - y|}{\left(\frac{x + y}{2}\right)} \times 100$$

where x is the original sample result and y is the duplicate sample result. When one result of a duplicate pair is below the MDL, the sample specific estimated quantification limit (ssEQL) is used for that result in the calculation. When both results are below the MDL, the RPD is not calculated.

The RPD should be less than 20% for water samples and less than 35% for solid samples when results are greater than the ssEQL. In the case where results are between the ssEQL and the MDL, the RPD should be less than 100% for water samples and less than 200% for soil samples. In the event analytical precision goals are not met, a determination of the usability of that information is made through the environmental data assessment process.

No records were rejected due to precision issues. Details for this project can be found in subsections 3.6*, Field Duplicate Relative Percent Difference (RPD)*.

F.2.2 Accuracy

Accuracy is defined as the closeness of agreement between an observed value and an accepted reference value. Accuracy is especially important when the concentration of concern approaches the detection limit and/or the action limit. When the concentration is underestimated near the detection limit, the analyte may be present but reported as not detected. When the concentration is underestimated near the action limit, the analyte may be at a concentration that would require remediation, but the remediation would not be performed. When the concentration is overestimated near the detection limit, the analyte may not be present but reported as detected. When the concentration is overestimated near the action limit, the analyte may not be at a concentration that would require remediation, but the remediation would be performed. The

sample types used to evaluate accuracy are performance evaluation studies LCSs, surrogate spikes, MSs, method blanks, trip blanks, and rinsate blanks.

LCSs monitor the performance of all steps in the analytical process, including sample preparation, and are used to identify problems with the analytical procedure. LCSs are deionized water that is spiked with the target analyte, digested, and analyzed with the regular samples. The LCS spiking solution is obtained from a third-party supplier or is prepared in the laboratory using chemicals from a different source than the calibration standards.

The LCS percent recovery is calculated as follows:

$$\%\ \text{Recovery} = \frac{\text{Blank spike concentration}}{\text{Spike concentration}} \times 100$$

One hundred percent recovery is equivalent to 100% accuracy. Values less than 100% or greater than 100% may indicate a sample matrix effect and a false reading. A periodic program of sample spiking is required (e.g., one MS and one MS duplicate per 20 samples). If analytical accuracy goals are not met, a determination is made through the environmental data assessment process relative to the usability of that information.

Eight (8) environmental records were rejected because the matrix spike/matrix spike duplicate (MS/MSD) were outside of limits. Details for this project can be found in subsections 3.4*, Trip Blanks*; 3.5, *Method Blanks*; 3.7, *Matrix Spike/Matrix Spike Duplicate Recovery (MS/MSD)*; and 3.8, *Laboratory Control Sample Recovery (LCS)*.

F.2.3 Representativeness

The representativeness of samples collected is controlled by adhering to the detailed descriptions of sampling procedures. Representativeness expresses the relative degree to which the data depict the characteristics of a population, parameter, sampling point, process condition, or environmental condition. The objective of this study is to accurately represent the concentrations of target analytes or compounds. Representative samples for this investigation will be required by implementing approved sampling and analytical procedures that will generate data representative of the sampling point location and will be maintained. Analytical methods are selected that will most accurately

represent the true concentration of the parameter of interest. The accumulation of QC procedures and information (i.e., RPD values, blank QC concentrations, MS percent recoveries, etc.) employed for a given analysis combine to exhibit the representativeness of the data generated.

The goal for representative sample data will therefore be met by properly documenting field and analytical protocols. In the event these procedures and methods are not able to be implemented, the appropriate corrective action documentation should encompass the impact on the representativeness of the information. When review of the data and documentation determines the data to be non-representative, the information is qualified in its use or is not used by the project.

All samples were collected and analyzed per established procedures.

F.2.4 Comparability

Comparability is the degree to which different methods, data sets, and decisions agree or can be represented as similar. The comparability of the data from the laboratories is based on the results of the split samples and on confirmation that the laboratories used the same standardized procedures for sample analysis, the same reporting unit, and obtained similar quantitation limits. Comparability of the data produced for this investigation may be obtained by implementing the identified protocols for sampling and analysis of samples. Implementation of traceable reference materials such as laboratory standards, expression of results in standard concentration units, and successful participation by the laboratories in external performance evaluation programs will enable the information produced through this investigation to be compared with future data sets, if required. For this project, four (4) split samples were collected and sent to the designated QC laboratory.

F.2.5 Completeness

Completeness is a measure of the amount of valid data obtained from a measurement system compared with the amount that was expected to be obtained under correct, normal circumstances. The Quality Assurance (QA) completeness objective for RFI/RI projects is to obtain valid field and laboratory analytical results for at least 90% of the samples collected during the project. This implies that completeness of sample collection (i.e., the number of samples collected compared to

the number of samples planned) must be virtually 100% to allow for some loss of data during the laboratory analytical process. Accountability of samples collected, from field to final disposal, must be 100%.

Completeness is a measure of the amount of data obtained from a measurement process that achieves the project goals as compared to the amount of data planned to be obtained by the project. Completeness is affected by unexpected conditions during the data collection process that reduce the usable data achieved relative to the data planned.

When review of the data and documentation determines the data to be incomplete, the impact relative to the project objective will be assessed and documented.

The following are measures of completeness:

Sample Collection:

$$\text{Completeness} = \frac{\text{Number of Sample Points Sampled}}{\text{Number of Sample Points Planned}} \times 100$$

Field Measurement:

$$\text{Completeness} = \frac{\text{Number of Valid Measurements Made}}{\text{Number of Measurements Planned}} \times 100$$

Laboratory Analysis:

$$\text{Completeness} = \frac{\text{Number of Valid Data Points}}{\text{Number of Data Points Planned}} \times 100$$

The completeness numbers for this project are listed below:

Sample Collection Completeness	100 %
Field Measurement Completeness	100 %
Laboratory Analysis Completeness	100 %

F.3 VALIDATION FINDINGS

F.3.1 Holding Times

This section discusses the holding times for the reported analyses and identifies whether the analyses met the recommended limits and if qualification was required for regular samples, field duplicate samples and split samples.

EPA8260D, Volatiles

Four (4) volatile organic records were qualified as approximate because the sample was held beyond normal holding time prior to analysis, UJ/Q.

Table F-4. Holding Time (HT) Review Qualifier Summary

Method Code	Total # of Records	# of Records Qualified for HT	Associated Samples Qualified
EPA8260D	*21,646*	*4*	*FY25-716A-00367*

F.3.2 Preservation

All chemical and physical preservation for the reported analyses were properly applied. No qualification was required.

Table F-5. Preservation Review Qualifier Summary

Method Code	Total # of Records	# of Records Qualified for Preservation	Associated Samples Qualified
EPA6010D	*2,515*	*0*

F.3.5 Method Blanks (MB)

This section discusses whether the MB results for the reported analyses were within the recommended limits and if qualification was required for regular samples, field duplicate samples and split samples.

F.3.5.1 EPA6010D, ICP-ES Metals

Twenty (20) antimony records were qualified as non-detect due to the detection of the analyte in the method blank, U/V.

One (1) antimony record was qualified as estimated due to the detection of the analyte in the method blank, J/V.

Three (3) arsenic records were qualified as non-detect due to the detection of the analyte in the method blank, U/V.

Three (3) arsenic records were qualified as estimated due to the detection of the analyte in the method blank, J/V.

Four (4) lead records were qualified as estimated due to the detection of the analyte in the method blank, J/V.

Eight (8) selenium records were qualified as non-detect due to the detection of the analyte in the method blank, U/V.

One (1) selenium record was qualified as estimated due to the detection of the analyte in the method blank, J/V.

Fifteen (15) silver records were qualified as non-detect due to the detection of the analyte in the method blank, U/V.

One (1) silver record was qualified as estimated due to the detection of the analyte in the method blank, J/V.

One (1) vanadium record was qualified as estimated due to the detection of the analyte in the method blank, J/V.

F.3.5.2 EPA6020B, ICP-ES Metals

One (1) antimony record was qualified as non-detect due to the detection of the analyte in the method blank, U/V.

Two (2) vanadium records were qualified as non-detect due to the detection of the analyte in the method blank, U/V.

F.3.5.3 EPA8260D, Volatile Organics

Twenty-four (24) volatile organics records were qualified as non-detect due to the detection of the analyte in the method blank, U/V.

Table F-9. Method Blank (MB) Review Qualifier Summary

Method Code	Total # of MB Records	# of MB Records Qualified	Associated Samples Qualified

F.3.7 Matrix Spike/Matrix Spike Duplicate Recovery (MS/MSD)

This section discusses whether the MS and MSD recoveries for the reported analyses were within the recommended limits and if qualification was required.

F.3.7.1 EPA6010D, ICP-ES Metals

One (1) selenium record was qualified as approximate due to the MS/MSD recovery was outside the established control limits, UJ/11.

Two (2) aluminum records were qualified as estimated due to the MS/MSD recovery was outside the established control limits, J/11.

One (1) magnesium record was qualified as estimated due to the MS/MSD recovery was outside the established control limits, J/11.

F.3.7.2 EPA8260D, Volatile Organics

Two (2) toluene records were qualified as approximate due to the MS/MSD recovery was outside the established control limits, UJ/11.

Three (3) acetone records were qualified as approximate due to the MS/MSD recovery was outside the established control limits, J/11.

One (1) acetone record was rejected due to the MS/MSD recovery was outside the established control limits, R/11.

F.3.7.3 EPA8270E, Semi-Volatiles

Two (2) 2,4-dinitrophenol records were qualified as approximate due to the MS/MSD recovery was outside the established control limits, UJ/11.

One (1) acetophenone record was qualified as approximate due to the MS/MSD recovery was outside the established control limits, UJ/11.

Two (2) benzaldehyde record was rejected due to the MS/MSD recovery was outside the established control limits, R/11.

One (1) dinitro-o-cresol record was rejected due to the MS/MSD recovery was outside the established control limits, R/11.

Two (2) hexachlorocyclopentadiene records was rejected due to the MS/MSD recovery was outside the established control limits, R/11.

F.3.9 Summary of Data Sensitivity Evaluation

This section summarizes the results of the data sensitivity evaluation. It applies to constituents that have a high percentage of non-detects (e.g., greater than 95% non-detect) to identify if the MDL exceeds the threshold screening criteria. The review of MDLs by matrix, method, and analyte relative to the human health risk-based thresholds (RSLs for nonradiological constituents) is presented in Table F-13.

Since this data is only being used for the PTSM evaluation, the MDL was compared to the 1E-03 RSL. For this dataset, none of the MDLs were greater than the 1E-03 RSL for non-detected constituents (Table F-13).

Table F-13. Data Sensitivity Summary

Method Code	Analyte	Total # of Non-Detects	Total # of Records	Total # of Records with MDL > RSL or PRG
NA	None	NA	NA	NA

F.4 DATA USABILITY

The analytical data of the samples collected from the soil beneath the remnant concrete slab at the 103 Lubrication Pit and drain lines and/or sewer lines within the 716-A Operable Unit are considered usable for purposes outlined in the *Remedial Investigation Work Plan for the Automotive Repair Shop (716-A) Operable Unit (U)*. Overall, eight (8) environmental sample records (0.068%) were rejected, which consisted primarily of the volatile organics due to matrix interference and the limitation of the analytical methods. The rejected data were not used. Although some sample results were J-qualified (estimated results) based on analytical conditions, the data are considered usable in the RI/Baseline Risk Assessment. Differences in sample results may also be attributed from sample matrix heterogeneity, rather than analytical uncertainty. Qualification details are found in Section 3.0, *Validation Findings.*

Soil	46.0-47.0' (46.5')		
Soil	51.0-52.0' (51.5')		

Drilling and Sampling Comments (Include drilling muds used, source of water, lost circulation zones, etc.)

Collected 11 soil samples for VOCs, SVOCs, metals and PCBs.

Please note that within the sampling interval cells the interval listed is for SVOCs, metals, and PCBs, while the specific depth listed in the parenthesis is the VOC sample depth.

Cored 0.6-57.1' bgs; Water sourced from B-Area Well Building (772-7B)

Concrete from 0.0-0.6'

Drilling Company	Driller (Last Name, First Initial)	Oversight Company	Oversight (Last Name, First Initial)
Cascade Drilling	Mills, A.	North Wind - Portage	Malin, M.

Disposition of Samples: Soil core disposed based on the IDW Plan Q-IDW-A-00005 Rev. 0, and soil samples were disposed by an offsite laboratory.
